Anmerkungen Remarks

1	Alle eingesetzten Prüfmittel waren zum angegebenen Prüfzeitraum gemäß eines festgelegten Kalibrierungsprogramms unseres Prüfhauses kalibriert. Sie entsprechen den in den Prüfprogrammen hinterlegten Anforderungen. Die Rückverfolgbarkeit der eingesetzten Prüfmittel ist durch die Einhaltung der Regelungen unseres Managementsystems gegeben. Detaillierte Informationen bezüglich Prüfkonditionen, Prüfequipment und Messunsicherheiten sind im Prüflabor vorhanden und können auf Wunsch bereitgestellt werden.
	calibration program. The equipment fulfils the requirements included in the relevant standards. The traceability of the test equipment used is ensured by compliance with the regulations of our management system. Detailed information regarding test conditions, equipment and measurement uncertainty is available in the test laboratory and could be provided on request.
2	Wie vertraglich vereinbart, wurde dieses Dokument nur digital unterzeichnet. Der TÜV Rheinland hat nicht überprüft, welche rechtlichen oder sonstigen diesbezüglichen Anforderungen für dieses Dokument gelten. Diese Überprüfung liegt in der Verantwortung des Benutzers dieses Dokuments. Auf Verlangen des Kunden kann der TÜV Rheinland die Gültigkeit der digitalen Signatur durch ein gesondertes Dokument bestätigen. Diese Anfrage ist an unseren Vertrieb zu richten. Eine Umweltgebühr für einen solchen zusätzlichen Service wird erhoben. Informationen zur Verifizierung der Authentizität unserer Dokumente erhalten Sie auf folgender Webseite: go.tuv.com/digital-signature
	As contractually agreed, this document has been signed digitally only. TUV Rheinland has not verified and unable to verify which legal or other pertaining requirements are applicable for this document. Such verification is within the responsibility of the user of this document. Upon request by its client, TUV Rheinland can confirm the validity of the digital signature by a separate document. Such request shall be addressed to our Sales department. An environmental fee for such additional service will be charged. For information on verifying the authenticity of our documents, please visit the following website: go.tuv.com/digital-signature
3	Prüfklausel mit der Note * wurden an qualifizierte Unterauftragnehmer vergeben und sind unter der jeweiligen Prüfklausel des Berichts beschrieben. Abweichungen von Prüfspezifikation(en) oder Kundenanforderungen sind in der jeweiligen Prüfklausel im Bericht aufgeführt.
	Test clauses with remark of * are subcontracted to qualified subcontractors and descripted under the respective test clause in the report. Deviations of testing specification(s) or customer requirements are listed in specific test clause in the report.
4	Die Entscheidungsregel für Konformitätserklärungen basierend auf numerischen Messergebnisen in diesem Prüfbericht basiert auf der "Null-Grenzwert-Regel" und der "Einfachen Akzeptanz" gemäß ILAC G8:2019 und IEC Guide 115:2021, es sei denn, in der auf Seite 1 dieses Berichts genannten angewandten Norm ist etwas anderes festgelegt oder vom Kunden gewünscht. Dies bedeutet, dass die Messunsicherheit nicht berücksichtigt wird und daher auch nicht im Prüfbericht angegeben wird. Zu weiteren Informationen bezueglich des Risikos durch diese Entscheidungsregel siehe ILAC G8:2019.
	The decision rule for statements of conformity, based on numerical measurement results, in this test report is based on the "Zero Guard Band Rule" and "Simple Acceptance" in accordance with ILAC G8:2019 and IEC Guide 115:2021, unless otherwise specified in the applied standard mentioned on Page 1 of this report or requested by the customer. This means that measurement uncertainty is not taken in account and hence also not declared in the test report. For additional information to the resulting risk based of this decision rule please refer to ILAC G8:2019.

Report No.: CN24PD8A 001

Summary of compliance with National Differences (List of countries addressed): EU

The product fulfils the requirements of <u>IEC 62477-1:2012+A1:2016, EN 62477</u> <u>1:2012+A11:2014+A12:2021</u>

Statement concerning the uncertainty of the measurement systems used for the tests (may be required by the product standard or client)

☐ Internal procedure used for type testing through which traceability of the measuring uncertainty has been established:

Procedure number, issue date and title:

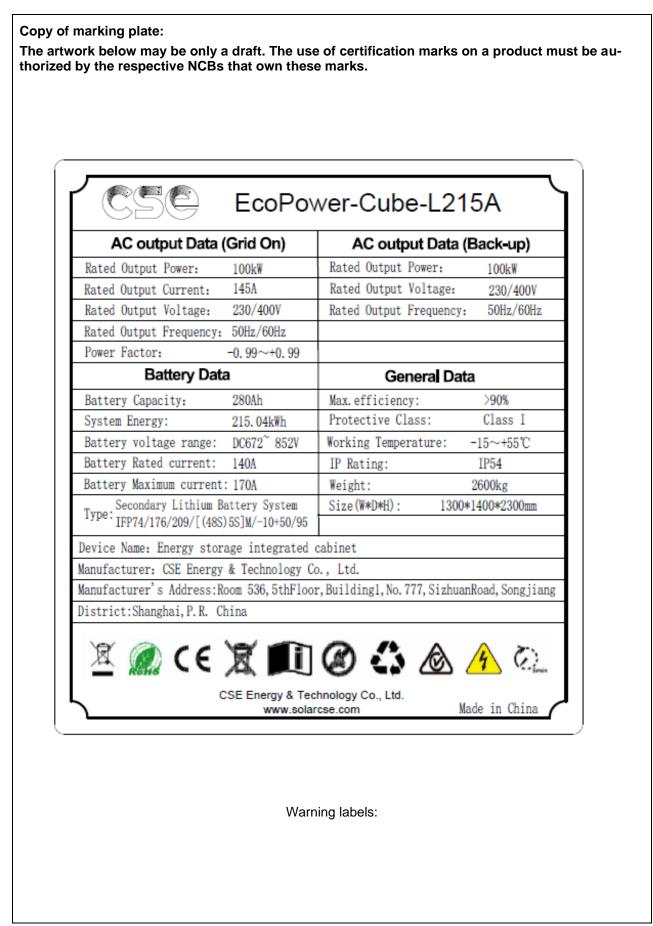

Calculations leading to the reported values are on file with the NCB and testing laboratory that conducted the testing.

 \boxtimes Statement not required by the standard used for type testing

(Note: When IEC or ISO standard requires a statement concerning the uncertainty of the measurement systems used for tests, this should be reported above. The informative text in parenthesis should be delete in both cases after selecting the applicable option)

Report No.: CN24PD8A 001

- 4. Auxiliary power should be supplied by separate OCV II mains.
- 5. The IP rating of the EUT is IP54, PD 2 inside and PD 3 outside evaluated.
- 6. The BMS functional safety was evaluated according to IEC 60730-1 Annex H.
- 7. The PCS is certified individually by TÜV Rheinland (Shanghai) Co., Ltd.

Insulation structure description of container

The Battery container is designed as isolation type. Please see the classification of circuit as below

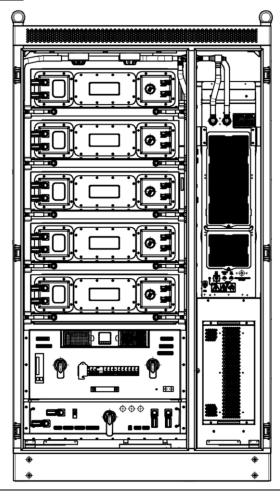

- Primary circuit: Battery input/output, AC input Auxiliary power input

- SELV circuit: External communication circuit of BMS control box and battery packs

Therefore

- Basic insulation between Primary circuit and earthed metal chassis

- Double/reinforced insulation between Primary circuit and SELV circuit, details see below table <u>Energy Storage System structure:</u>

End-of-charge voltage [V]	3.9	3.55V*48(170.4v)	3.55V*240(852v)
End-of-discharge voltage [V]	2.5(T≥0°C); 2(T<0°C)	2.8V*48(134.4V)	2.8V*240(672V)
Discharge cut-off voltage [V]	2.5(T≥0°C); 2(T<0°C)	2.8V*48(134.4V)	2.8V*240(672V)
Temperature range for charging [°C]	0 to 65	3 to 52	3 to 52*
Temperature range for discharging [°C]	-30 to 65	-15 to 52	-15 to 52
Operating ambient temperature [°C]			-15 to 55
Temperature threshold for protection		53	53
Overcharge protected voltage supply by battery system		≥3.60V /Cell	≥3.60V /Cell
Recommend charging method by manufacturer	At constant power 448W till cell voltage reaches 3.65V, and rest for 30min at 25 ± 2°C	Charge at constant current 140A until the voltage reaches 170.4V	Charge at constant current 140A until the voltage reaches 852V
Dimension [mm]	(71.70±1.5)mm* (173.70±1.5)mm* (207.20±1.5)mmT*W *H(mm) without ter- minal	L(1142.5±2)mm*W(810±1)m m*(249±2)mm T*W*H(mm) without terminal	1300*1400*2300mm T*W*H(mm) without terminal
Weight [kg]	5.48±0.3	320kg(±1%)	2600kg(±1%)
Ingress Protection (IP)		IP67	IP54
Protective Class	-	-	I
Cooling type	-	Liquid cooling	Liquid cooling
Altitude	-	2000m	2000m

*:Battery protection is set by cell temperature setting, The ambient temperature of the equipment is quite different from the actual temperature of the battery cell.

*: When the cell temperature is not greater than 45 $^{\circ}$ C and not lower than 15 $^{\circ}$ C, the constant current charge is 140A, the maximum charge and discharge current is 170A, and the derating begins when the cell temperature is greater than 45 $^{\circ}$ C

*:When the cell temperature reaches 45 degrees, the charge and discharge power is reduced to half of the rated power; When the cell temperature reaches 52 degrees, stop charging and discharging.

*: The temperature of the cell is below minus 5 degrees, and it is discharged at 0.2C current

Requirement – Test

Clause

Report No.: CN24PD8A 001

IEC 62477-1

Result – Remark

Verdict

4	PROTECTION AGAINST HAZARDS		Р
4.1	General		Р
4.2	Fault and abnormal conditions	See Table 4.2 to 4.3	Р
	Components in 4.2 also include insulation systems, ports, etc (IEC 62477-1:2012/AMD1:2016)		Р
4.3	Short-circuit and overcurrent protection	See Table 4.2 to 4.3	Р
4.3.1	General	No hazards under short circuit or overload conditions at any port.	Ρ
4.3.2	Specification of prospective short-circuit current		Р
4.3.2.1	General		Р
	The interrupting capability of the overcurrent pro- tective device shall be equal or greater than the prospective short circuit current of the mains sup- ply.		Ρ
	For pluggable equipment type A, either the PECS shall be designed so that the building installation provides short circuit backup protection, or addi- tional short circuit backup protection shall be pro- vided as part of the equipment.	Permanently connected equipment	N/A
	For permanently connected equipment or pluggable equipment type B, it is permitted for short circuit backup protection to be in the building installation.	Considered	Ρ
4.3.2.2	Specification of the rated conditional short-circuit current (I _{cc}) on input ports (IEC 62477-1:2012/AMD1:2016)		Ρ
	In case the PECS manufacturer selects the condition ing according to 4.3.1, the following specified: (IEC 6		Р
	- conditional short-circuit current (Icc), (IEC 62477- 1:2012/AMD1:2016)		Р
	- characteristics of the short-circuit protective de- vice, and (IEC 62477-1:2012/AMD1:2016)		Р
	- minimum required prospective short-circuit current (Icp,mr) (IEC 62477-1:2012/AMD1:2016)		Р
	If it is shown by analysis that the result of one test is representative of the worst case, less severe combinations need not be tested. (IEC 62477- 1:2012/AMD1:2016)		Ρ
4.3.2.3	Output short circuit current ability		Р
	The output short circuit current ratings apply to a.c. and d.c. power output ports and to other ports for which overcurrent protection is necessary.		Р
	For all output ports, short circuit evaluation to de- termine the minimum and maximum output short circuit current shall be performed according to 5.2.4.4 and the output short circuit current available

Ρ

	Page 18 of 85	Report No.: CN2	4PD8A 00 ⁻
	IEC 62477-1		
Clause	Requirement – Test	Result – Remark	Verdict
	from the PECS shall be specified as in 5.2.4.4 and 6.2. Internal electronic output short circuit protection is		
	considered acceptable as an output short circuit protection device of the PECS, when compliance is shown by test in 5.2.4.4.		
4.3.2.4	Combined input and output ports		Р
	For ports which are both input and output ports the applicable requirements of both 4.3.2.1 and 4.3.2.3 apply.	Bi-directional equipment	Р
4.3.3	Short-circuit coordination (backup protection)		Р
	Protective devices provided or specified shall have adequate breaking capability to interrupt the maxi- mum prospective short circuit current specified for the port to which they are connected.		Р
	If internal protection of the PECS is not rated for the prospective short circuit current, the installation in- structions shall specify an upstream protective de- vice, rated for this prospective short circuit current of that port, which shall be used to provide backup protection. Analysis shall ensure the protection co- ordination between the external and internal protec- tive device.		
	Compliance shall be checked by inspection and by the tests of 5.2.4.4 and 5.2.4.5.		Р
4.3.4	Protection by several devices		Р
	Where protective devices that require manual re- placement or resetting are used in more than one pole of a supply to a given load, those devices shall be located together. It is permitted to combine two or more protective devices in one component. Compliance shall be checked by inspection.		P
4.3.5	Input ports short time withstand current, Icw (IEC 62477-1:2012/AMD1:2016)		N/A

In case the PECS manufacturer selects the short time withstand current (Icw) rating

according to 4.3.1, the following specified: (IEC 62477-1:2012/AMD1:2016)

- rated short time withstand current (Icw), (IEC

- rated peak withstand current (Ipk). (IEC 62477-

If it is shown by analysis that the result of one test

is representative of the worst case, less severe combinations need not be tested. (IEC 62477-

Protection against electric shock

4.4

IEC 62477-1

Page 19 of 85

	Page 19 of 85 IEC 62477-1	Report No.: CN2	4FDOA U
Clause	Requirement – Test	Result – Remark	Verdict
4.4.1	General		Р
4.4.2	Decisive voltage classification		Р
4.4.2.1	General	Considered	Р
4.4.2.2	Determination of decisive voltage class	•	
4.4.2.2.1	General		Р
	For protection against the ventricular fibrillation body reaction, DVC can be selected from Table 2.		Р
4.4.2.2.2	Selection tables for contact area and skin humidity condition		Р
	In order to protect against ventricular fibrillation, the appropriate conditions from Table 3 and Table 4 shall be selected.		Р
4.4.2.2.3	Limits of the working voltage for the DVC		Р
4.4.2.3	Requirements for protection against electric shock		Р
4.4.3	Provision for basic protection	•	Р
4.4.3.1	General	Considered	Р
4.4.3.2	Protection by means of insulation of live parts		Р
	Live parts shall be completely surrounded with in- sulation if their working voltage is greater than DVC As or if they do not have protective separation from adjacent circuits of DVC C.	All the live parts greater than DVC A can't be touched.	Р
	Basic insulation may be provided by solid insulation or air clearance.		Р
	The insulation shall be rated according to the im- pulse voltage, temporary overvoltage or working voltage (see 4.4.7.2.1), whichever gives the most severe requirement. It shall not be possible to re- move the insulation without the use of a tool or key.		P
4.4.3.3	Protection by means of enclosures or barriers	Considered	Р
	Live parts with voltage higher than DVC As shall be: - arranged in enclosures or located behind enclo- sures or barriers, which meet at least the require-	IP54	Р
	ments of the Protective Type IPXXB according to Clause 7 of IEC 60529:1989;		
	- located at the top surfaces of enclosures or barri- ers which are accessible when the equipment is energized shall meet at least the requirements of the protective type IP3X with regard to vertical ac- cess only.		
	For moveable equipment with no defined top and bottom this requirement of protective Type IP3X applies to all sides.		N/A
	If the PECS is installed in a restricted access area, IPXXB instead of IP3X applies.		N/A

be made so that the PE conductor in the cord shall, in the case of failure of the strain-relief mechanism, be the last conductor to be interrupted.		
For special system topologies, the PECS designer shall verify the PE conductor cross-section re- quired.		P
Means of connection for the PE conductor		Р
PECS shall have a means of connection for the PE conductor, located near the terminals for the re- spective live conductors. The means of connection shall be corrosion-resistant and shall be suitable for the connection of conductors according to Table 7 and of cables in accordance with the wiring rules applicable at the installation. The means of connec- tion for the PE conductor shall not be used as a part of the mechanical assembly of the equipment or for other connections. Connection and bonding points shall be designed so that their current- carrying capacity is not impaired by mechanical, chemical, or electrochemical influences. Where enclosures and/or conductors of aluminium or aluminium alloys are used, particular attention should be given to the problems of electrolytic cor- rosion. Compliance shall be checked by inspection.		P
Touch current in case of failure of PE conductor		Р
 For all other PECS, one or more of the following measures shall be applied, unless the touch current can be shown to be less than the limits specified in 4.4.3.4: a) Use of a fixed connection and a cross-section of the PE conductor of at least 10 mm² Cu or 16 mm² Al; or automatic disconnection of the PE conductor of the supply in case of discontinuity of the PE conductor; or 		P
	 and of cables in accordance with the wiring rules applicable at the installation. The means of connection for the PE conductor shall not be used as a bart of the mechanical assembly of the equipment or for other connections. Connection and bonding boints shall be designed so that their current-carrying capacity is not impaired by mechanical, chemical, or electrochemical influences. Where enclosures and/or conductors of aluminium or aluminium alloys are used, particular attention should be given to the problems of electrolytic corrosion. Compliance shall be checked by inspection. For all other PECS, one or more of the following measures shall be applied, unless the touch current can be shown to be less than the limits specified in 4.4.3.4: a) Use of a fixed connection and a cross-section of the PE conductor of at least 10 mm² Cu or 16 mm² Al; or automatic disconnection of the PE conductor 	and of cables in accordance with the wiring rules applicable at the installation. The means of connec- ion for the PE conductor shall not be used as a part of the mechanical assembly of the equipment or for other connections. Connection and bonding points shall be designed so that their current- carrying capacity is not impaired by mechanical, chemical, or electrochemical influences. Where enclosures and/or conductors of aluminium or aluminium alloys are used, particular attention should be given to the problems of electrolytic cor- rosion. Compliance shall be checked by inspection. Fouch current in case of failure of PE conductor For all other PECS, one or more of the following measures shall be applied, unless the touch current can be shown to be less than the limits specified in 4.4.3.4: a) Use of a fixed connection and • a cross-section of the PE conductor of at least 10 mm ² Cu or 16 mm ² Al; or • automatic disconnection of the supply in case of discontinuity of the PE conduc- tor; or

cross-sectional area as the original PE conductor;		

	cross-sectional area as the original PE conductor;		
	b) Use of a pluggable type B connection with a min- imum PE conductor cross-section of 2,5 mm ² as part of a multi-conductor power cable. Adequate strain relief shall be provided.		
	Compliance is checked by inspection and by test of 5.2.3.7.		Р
4.4.4.4	Automatic disconnection of supply	No such part	N/A
	 For automatic disconnection of supply: a protective equipotential bonding system shall be provided; and a protective device operated by the fault current shall disconnect one or more of the line conductors supplying the equipment, system or installation, in specific feature of basic insulation. 		N/A
	case of a failure of basic insulation. The protective device shall interrupt the fault cur- rent within a time as specified in Figure 1, Figure 2 or Figure 3 in 4.4.2.2.3.		
4.4.4.5	Supplementary insulation	Considered	Р
4.4.4.6	Simple separation between circuits		Р
	If any component is connected between the separated circuits, that component shall withstand the electric stresses specified for the insulation which it bridges.If any component is connected between a circuit and a circuit connected to earth, its impedance shall limit the current flow through the component to the steady-state touch current values indicated in 4.4.3.4.		Ρ
4.4.4.7	Electrically protective screening		N/A
	Electrically protective screening interposed be- tween hazardous live parts of a PECS, shall consist of a conductive screen connected to the protective equipotential bonding of the PECS whereby the screen is separated from live parts by at least sim- ple separation. The protective screen and the connection to the protective equipotential bonding system of the PECS and that interconnection shall comply with the requirements of 4.4.4.2.		N/A
4.4.5	Enhanced protection	1	Р
4.4.5.1	General		Р
	Enhanced protection shall provide both basic and fault protection and can be achieved by means of: • Reinforced insulation in 4.4.5.2; • Protective separation between circuits in 4.4.5.3;		Р

Clause

IEC 62477-1

Clause

Requirement – Test	Result – Remark	Verdict
Protection by means of in 4.4.5.4.		
Reinforced insulation		Р
Reinforced insulation shall be so designed as to be able to withstand electric, thermal, mechanical and		Р

4.4.5.2	Reinforced insulation		Р
	Reinforced insulation shall be so designed as to be able to withstand electric, thermal, mechanical and environmental stresses with the same reliability of protection as provided by double insulation. (basic insulation and supplementary insulation, see 4.4.3.2 and 4.4.4.5)		Ρ
4.4.5.3	Protective separation between circuits		Р
	 Protective separation between a circuit and other circuits shall be achieved by one of the following means: double insulation (basic insulation and supplementary insulation in 4.4.3.2 and 4.4.4.5); reinforced insulation in 4.4.5.2; electrically protective screening in 4.4.4.7; a combination of these provisions. 	Between DC power circuit and communication circuit. Between the communication port and AC circuit	Ρ
	If conductors of the separated circuit are contained together with conductors of other circuits in a multi- conductor cable or in another grouping of conduc- tors, they shall be insulated, individually or collec- tively, for the highest voltage present, so that dou- ble insulation is achieved. If any component is connected between the sepa- rated circuits, that component shall comply with the requirements for protective impedance devices (see 4.4.5.4)		Ρ
4.4.5.4	Protection by means of protective impedance		N/A
	Protective impedance shall be arranged so that un- der both normal and single fault conditions the cur- rent and discharge energy available shall be limited according to 4.4.3.4.		N/A
	The protective impedances shall be designed and tested to withstand the impulse voltages and temporary overvoltages for the circuits to which they are connected. See 5.2.3.2 and 5.2.3.4 for tests.		N/A
	Compliance with the requirement for the limitation of touch current is checked by test of 5.2.3.7.		Р
	Compliance with the requirement for the discharge energy shall be checked by performing calculations and/or measurements to determine the voltage and capacitance.		N/A
	NOTE A protective impedance designed according to this subclause is not considered to be a galvanic connection.		
4.4.6	Protective measures		Р
4.4.6.1	General		Р

Report No.: CN24PD8A 001

IEC 62477-1

Clause	Requirement – Test	Result – Remark	Verdict
4.4.6.2	Protective measures for protective class I equip- ment		Р
	Protective class I equipment shall meet the re- quirements for: • basic protection in 4.4.3; and		Р
	• fault protection in 4.4.4.2 and 4.4.4.3 with respect to equipotential bonding and PE conductor.		
4.4.6.3	Protective measures for protective class II equip- ment	Class I equipment	N/A
	 Protective class II equipment shall meet the requirements for enhanced protection according to 4.4.5 and the enclosure shall meet the requirement for basic protection in 4.4.3 with respect to accessibility to hazardous live parts. Protective class II equipment shall not have means of connection for the PE conductor. This does not apply if a PE conductor is passed through the equipment to equipment series-connected beyond it. In the latter case the PE conductor and its means for connection shall be separated from: accessible surface of the equipment; and circuits which employ protective separation with at least simple separation according to the requirement in 4.4.6. 		N/A
	 ment. Equipment of protective class II may have provision for the connection of an earthing conductor for functional reasons or for the damping of overvoltages. In this case, the functional earthing conductor shall be separated from: accessible surface of the equipment; and circuits which employ protective separation according to 4.4.5.3 with at least protective separation according to the requirement in 4.4.5.3. Equipment of protective class II shall be marked according to 6.3.7.3.3. 		
	Compliance is checked by inspection.		
4.4.6.4	Protective measures for protective class III equipment		N/A
4.4.6.4.1	General	Class I equipment	N/A
	Protective measures shall be achieved by protec- tive separation by one of the following means:		N/A

• basic insulation and supplementary insulation (double insulation) according to 4.4.3.2 and 4.4.4.5;

IEC 62477-1

Page 26 of 85

IEC 62477-1				
Requirement – Test	Result – Remark	Verdict		
 reinforced insulation according to 4.4.5.2; 				
 electrically protective screening and simple sepa- ration according to 4.4.4.7; or 				

	 electrically protective screening and simple separation according to 4.4.4.7; or a combination of these provisions; 		
	used in combination with one of the following means:		
	 protective impedance according to 4.4.5.4 comprising limitation of discharge energy and of current; or limitation of voltage according to 4.4.3.5. 		
	The protective separation shall be fully and effec- tively maintained under all conditions of intended use of the PECS.		N/A
4.4.6.4.2	Connection to PELV and SELV circuits		Р
	If a port is intended for connection of an external PELV or SELV circuit with a higher voltage than DVC As:	The communication port is SELV.	Р
	 measures to limit the voltage to that of DVC As shall be taken (see Annex A); or 		
	 basic protection shall be provided. 		
	For connectors containing pins with very small con- tact area (< 1 mm ²), the next higher voltage level for DVC As, of Table 5, is permitted. Example: if DVC A1 is DVC As, then DVC A2 is permitted at pins of signal connectors.		
	The connection of external PELV or SELV circuits to an internal circuit is permitted with the following consideration:		
	• without measures: only if the DVC of the PELV and SELV voltage are lower than or equal to the DVC selected from Table 5 for the internal circuit under consideration; and		
	• with measures: if the DVC of the PELV and SELV voltage are higher than the DVC selected from Table 5 for the internal circuit under consideration.		
	The possibility of an addition of the voltages of the circuits under consideration to a higher level under fault conditions shall be considered.		
	For marking, see 6.3.7.1.		
	Consideration needs to be given to factors such as whether the circuits involved are earthed or not, what the voltages involved are, whether or not di- rect contact with live parts is possible, single faults in either equipment or the interconnections, etc.		
4.4.7	Insulation		Р
4.4.7.1	General		Р
4.4.7.1.1	Influencing factors		Р
	This subclause gives minimum requirements for in- sulation, based on the principles of IEC 60664.		Р

Clause

IEC 62477-1

Page 27 of 85

Clause	Requirement – Test	Result – Remark	Verdict
-		1	r
	Insulation shall be selected after consideration of the following influences:		Р
	 pollution degree; overvoltage category; supply system earthing; 		
	 impulse withstand voltage, temporary over- voltage and working voltage; location of insulation; 		

	 impulse withstand voltage, temporary over- voltage and working voltage; 		
	 location of insulation; 		
	- type of insulation.		
	Verification of insulation shall be made according to 5.2.2.1, 5.2.3.2, 5.2.3.4 and 5.2.3.5.		Р
4.4.7.1.2	Pollution degree		Р
	Insulation, especially when provided by clearances and creepage distances, is affected by pollution which occurs during the expected lifetime of the PECS. The micro-environmental conditions for in- sulation shall be applied according to Table 8.	PD 2 inside	P
	The pollution degree shall be determined according to the environmental condition for which the product is specified. See Table 18 for selection of pollution degree according to environmental classification of the installation.		P
	The insulation may be determined according to pol- lution degree 2 if one of the following applies:	IP54	Р
	a) instructions are provided with the PECS indicat- ing that it shall be installed in a pollution degree 2 environment; or		
	b) the specific installation application of the PECS is known to be a pollution degree 2 environment; or		
	c) the PECS enclosure or coatings applied within the PECS according to 4.4.7.8.4.2 or 4.4.7.8.6 pro- vide adequate protection against what is expected in pollution degree 3 and 4 (conductive pollution and condensation).		
	The PECS manufacturer shall state in the docu- mentation the pollution degree for which the PECS has been designed.		P
	If operation in a pollution degree 4 environment is required, protection against conductive pollution shall be provided by means of a suitable enclosure.		N/A
4.4.7.1.3	Overvoltage category (OVC)		Р
	The measures for reduction of the impulse voltage shall ensure that the temporary overvoltages that could occur are sufficiently limited so that their peak value does not exceed the relevant rated impulse voltage of Table 9 and shall meet the requirement of 4.4.7.2.2, 4.4.7.2.3 and 4.4.7.3 as applicable.		Ρ
	Four categories are considered. • Equipment of overvoltage category IV (OVC IV) is	AC power circuit considered as OVC III,	Р

IEC 62477-1

Page 28 of 85

Clause				
Clause	Requirement – Test	Result – Remark	Verdict	
	 for use at the origin of the installation. Equipment of overvoltage category III (OVC III) is equipment in fixed installations and for cases where the reliability and the availability of the equipment are subject to special requirements. 	DC power circuit considered as OVC II.		
	• Equipment of overvoltage category II (OVC II) is energy-consuming equipment to be supplied from the fixed installation.			
	• Equipment of overvoltage category I (OVC I) is equipment for connection to circuits in which measures are taken to limit transient overvoltages to an appropriately low level.			
4.4.7.1.4	Supply earthing systems		Р	
	The following three basic types of system earthing are described in IEC 60364-1.		Р	
	• TN system: has one point directly earthed, the ac- cessible conductive parts of the installation being connected to that point by protective conductors. Three types of TN system, TN-C, TN-S and TN-C- S, are defined according to the arrangement of the neutral and protective conductors.			
	• TT system: has one point directly earthed, the ac- cessible conductive parts of the installation being connected to earth electrodes electrically inde- pendent of the earth electrodes of the power sys- tem.			
	• IT system: has all live parts isolated from earth or one point connected to earth through an imped- ance, the accessible conductive parts of the instal- lation being earthed independently or collectively to the system earthing.			
4.4.7.1.5	Determination of impulse withstand voltage and temporary overvoltage		Р	
	 Table 9 uses the system voltage (see 4.4.7.1.6) and overvoltage category of the circuit under consideration to determine the impulse withstand voltage. The system voltage is also used to determine the temporary overvoltage. A PECS having more than one input or output shall be evaluated according to the input or output which gives the most severe requirements. 		P	
4.4.7.1.6	Determination of the system voltage		Р	
4.4.7.1.6.1	For mains supply	See model list	Р	
4.4.7.1.6.2	For non-main supply	Max. DC 1000V	Р	
	For PSCS supplied by non-mains a.c. or d.c., the system voltage is the r.m.s. value of the supply voltage between phases.		P	
4.4.7.1.7	Components bridging insulation		Р	
	Components bridging insulation shall comply with		Р	

IEC 62477-1

Page 29 of 85

		1	
Clause	Requirement – Test	Result – Remark	Verdict
	the requirements of the level of insulation (e.g. basic, reinforced, double) they are bridging.		
4.4.7.2	Insulation to the surroundings		Р
4.4.7.2.1	General		Р
4.4.7.2.2	Circuits connected to mains supply		Р
	Insulation between the surroundings and circuits which are connected directly to the mains supply shall be designed according to the impulse with- stand voltage, temporary overvoltage, or working voltage, whichever gives the most severe require- ment.		Ρ
4.4.7.2.3	Circuits connected to Non-mains supply		Р
	Insulation between the surroundings and circuits supplied from a non-mains supply shall be de- signed according to:		Ρ
	• the impulse withstand voltage determined from Table 9 using the system voltage;		
	 the working voltage; the temporary overvoltage if known to exist due to the nature of the supply; 		
	whichever gives the more severe requirement. Temporary overvoltage on a non-mains supply		P
	shall be determined as follows:Without detailed knowledge of the temporary		
	overvoltage, it shall be according to Table 9.If the temporary overvoltage is known this value shall be used.		
	By the determination of temporary overvoltages on non-mains supply, following situations should be considered:		Р
	 loss of the neutral in a non-mains low-voltage system; 		
	 accidental earthing of a non-mains low voltage IT system; and 		
	• short circuit in the non-mains low voltage installa- tion.		
4.4.7.2.4	Insulation between circuits		Р
	Insulation between two circuits shall be designed according to the circuit having the more severe re- quirement.	Basic insulation between the DC/AC main circuit and PE. Double insulation between the	Р
	For the design of simple and protective separation between circuits the insulation shall be designed according to:	DC/AC main circuit and com- munication port.	
	• the circuit having the more severe requirement; or		
	 the working voltage between the circuits; whichever gives the most severe requirement. 		
4.4.7.3	Functional insulation		P

IEC 62477-1

Page 30 of 85

Page 30 of 85 Report No.: CN24PD8A 00				
	IEC 62477-1			
Clause	Requirement – Test	Result – Remark	Verdict	
	If the failure of functional insulation does not pro- duce a hazard (electrical, thermal, fire), no specific requirements apply for the dimensioning of func- tional insulation. In other cases the following re- quirements apply. Testing is not required, except where the circuit analysis required by 4.2 shows that failure of the insulation could result in a hazard. For parts or circuits that are significantly affected by		P	
	external transients, functional insulation shall be designed according to the impulse withstand volt- age of overvoltage category II, except that over- voltage category III shall be used when the PECS is connected at the origin of the installation.			
	Where measures are provided that reduce transient overvoltages within the circuit from category III to values of category II, or values of category II to val- ues of category I, functional insulation may be de- signed for the reduced values.			
	Where the circuit characteristics can be shown by testing (see 5.2.3.2) to reduce impulse voltages, functional insulation may be designed for the highest impulse voltage occurring in the circuit during the tests.			
	For parts or circuits that are not significantly affect- ed by external transients, functional insulation shall be designed according to the working voltage across the insulation.			
4.4.7.4	Clearance distance		Р	
4.4.7.4.1	Determination	See Table 4.4.7.4	Р	
	Clearances for functional, basic and supplementary insulation shall be dimensioned according to Table 10 (see Annex D for examples of the evaluation of clearance distances). Interpolation is permitted, when clearance is determined from temporary overvoltage or working voltage. Clearances for reinforced insulation shall be di-		P	
	mensioned to withstand an impulse voltage one step higher than the impulse withstand voltage, or 1,6 times the peak temporary overvoltage or peak working voltage, required for basic insulation.			
	Clearance distances for use in altitudes between 2 000 m and 20 000 m shall be calculated using a correction factor according to Table A.2 of IEC 60664-1:2007, which is reproduced as Table E.1.			
	A correction factor selected from Table F.2 is also used for determination of clearance distances for approximately homogenous fields when frequen- cies are greater than 30 kHz, as given in Annex F.			
	Compliance shall be checked by visual inspection (see 5.2.2.1) or by performing the impulse voltage test of 5.2.3.2 and the a.c. or d.c. voltage test of		Р	

IEC 62477-1

Page 31 of 85

Clause	Requirement – Test	Result – Remark	Verdict
--------	--------------------	-----------------	---------

	5.2.3.4.		
4.4.7.4.2	Electric field homogeneity		Р
	The dimensions in Table 10 correspond to the re- quirements of an inhomogeneous electric field dis- tribution across the clearance, which are the condi- tions normally experienced in practice. If a homo- geneous electric field distribution is known to exist, the clearance distance for basic or supplementary insulation may be reduced to not less than that re- quired by Table F.2 (Case B) of IEC 60664-1:2007. In this case, however, the impulse voltage test of 5.2.3.2 shall be performed across the considered clearance. If the withstand against steady state voltages, re- curring peak or temporary overvoltages according to Table 10 is decisive for the dimensioning of clearance and if these clearances are smaller than the values of Table 10 then an a.c. or d.c. voltage test according to 5.2.3.4 is required. Clearance dis- tances for reinforced insulation shall not be reduced for homogeneous fields.		Ρ
4.4.7.4.3	Clearance to conductive enclosures		Р
	The clearance between any non-insulated live part and the walls of a metal enclosure shall be in ac- cordance with 4.4.7.4.1 during and following the de- flection tests of 5.2.2.4.2.		Ρ
	Compliance is checked by inspection and by test of 5.2.2.4.2.		Р
	If the design clearance distance is at least 12,7 mm and the clearance distance required by 4.4.7.4.1 does not exceed 8 mm, the deflection tests may be omitted.		Ρ
4.4.7.5	Creepage distance		Р
4.4.7.5.1	Insulating material groups		Р
	Creepage distance requirements for PWBs exposed to pollution degree 3 environmental conditions shall be determined based on Table 11 pollution degree 3 under "Other insulators".		Р
	For inorganic insulating materials, for example glass or ceramic, which do not track, the creepage distance may equal the associated clearance distance, as determined from Table 10.		Р
4.4.7.5.2	Determination	See Table 4.4.7.5	Р
	Creepage distances for functional, basic and sup- plementary insulation shall be dimensioned accord- ing to Table 11. Interpolation is permitted. Creep- age distances for reinforced insulation shall be twice the distances required for basic insulation.		Ρ
	When the creepage distance requirement deter-		Р

IEC 62477-1

Page 32 of 85

	IEC 02477-1		
Clause	Requirement – Test	Result – Remark	Verdict
	mined from Table 11 is less than the clearance dis- tance required by 4.4.7.4.1 or the clearance dis- tance determined by impulse testing (see 5.2.3.2), then the creepage distance shall be increased to the clearance distance.		
	Compliance of creepage distances shall be checked by measurement or inspection (see 5.2.2.1) (see Annex D for examples of the evalua- tion of creepage distances).		Р
4.4.7.6	Coating	No such part	N/A
	A coating may be used to provide insulation, to pro- tect a surface against pollution, and to allow a re- duction in creepage and clearance distances (see 4.4.7.8.4.2 and 4.4.7.8.6)		N/A
4.4.7.7	PWB spacings for functional insulation		Р
	Spacings for functional insulation shall comply with the requirement of 4.4.7.4 and 4.4.7.5.		Р
	Decreased spacings on PWB are permitted when all the following are satisfied:		Р
	 the PWB has flammability rating of V-0 (see IEC 60695-11-10); the PWB base material has a minimum CTI of 100; the equipment complies with the PWB short circuit test (see 5.2.4.7). 		
	Decreased spacings for components assembled on PWB are permitted when used in:		
	 pollution degree 1 or 2 environment; and not more than overvoltage category I. 		
	In this case the manufacture specification may be used.		
	Compliance is checked by inspection and by test of 5.2.4.7 if applicable.		
4.4.7.8	Solid insulation		Р
4.4.7.8.1	General		Р
	Materials selected for solid insulation shall be able to withstand the stresses occurring. These include mechanical, electrical, thermal, climatic and chemi- cal stresses which are to be expected in normal use. Insulation materials shall also be resistant to ageing during the expected lifetime of the PECS.		P
	Tests shall be performed on components and sub- assemblies using solid insulation, in order to ensure that the insulation performance has not been com- promised by the design or manufacturing process.		
4.4.7.8.2	Material requirements		Р
	The insulating material shall have a CTI of 100 or		Р

IEC 62477-1

Page 33 of 85

Б П ، ام

Clause	Requirement – Test	Result – Remark	Verdict
	greater. The insulating material shall be suitable for the maximum temperature it attains as determined by the temperature rise test of 5.2.3.10. Consideration shall be given as to whether or not the insulating material additionally provides mechanical strength and whether or not the part can be subject to im- pact during use.		
	The insulating material in contact with live parts higher than DVC As shall comply with:		Р
	 the glow-wire test described in 5.2.5.3 at a test temperature of 850 °C; or the glow-wire test described in 5.2.5.3, at a lower test temperature, but not less than 550 °C, depending on the classification of the use of the PECS, according to Table A.1 of IEC 60695-2-11:2011; or 		
	• the alternative hot wire ignition test of 5.2.5.4.		
	Thermoplastic insulating materials used in contact with live parts higher than DVC As or used as part of the enclosure shall comply with the ball pressure test as abnormal heat test according to IEC 60695- 10-2.		P
	Where an insulating material is used in a PECS that incorporates switching contacts, and is within 12,7 mm of the contacts, it shall comply with the high current arcing ignition test of 5.2.5.2.		Р
	In case the manufacturer of the insulating material provides data to demonstrate compliance with the above requirements no further testing is required. No further evaluation is required when generic ma- terials are used according to Table 12.		Р
	Compliance is checked by inspection and by test of 5.2.3.10 and 5.2.5.3 or 5.2.5.2.		Р
4.4.7.8.3	Thin sheet or tape material	L	Р
4.4.7.8.3.1	General		Р
	 4.4.7.8.3 applies to the use of thin sheet or tape materials in assemblies such as wound components and bus-bars. Insulation consisting of thin (less than 0,75 mm) sheet or tape materials is permitted, provided that it is protected from damage and is not subject to mechanical stress under normal use. 		Ρ
	Where more than one layer of insulation is used, there is no requirement for all layers to be of the same material. NOTE 1 One layer of insulation tape wound with		
	more than 50 % overlap is considered to constitute two layers.		
	NOTE 2 Basic, supplementary and double insula- tion can be applied as a pre-assembled system of		

	Page 34 of 85 Report No.: CN24PD8A 00 IEC 62477-1			
Clause	Requirement – Test	Result – Remark	Verdic	
		I		
	thin materials.			
4.4.7.8.3.2	Material thickness ≥ 0,2 mm		Р	
	Basic or supplementary insulation shall consist of at least one layer of material, which will meet the requirements of 4.4.7.8.1 and 4.4.7.10.1.		Р	
	Double insulation shall consist of at least two layers of material, each of which will meet the require- ments of 4.4.7.8.1, 4.4.7.10.1, and the partial dis- charge requirements of 4.4.7.10.2, and both layers together will meet the impulse and a.c. or d.c. volt- age requirements of 4.4.7.10.2.		Р	
	Reinforced insulation shall consist of a single layer of material, which will meet the requirements of 4.4.7.8.1 and 4.4.7.10.2.		Р	
	NOTE The requirements of this subclause indicate that double insulation can be at least 0,4 mm thick, while reinforced insulation is permitted to be 0,2 mm thick.		Р	
4.4.7.8.3.3	Material thickness less than 0,2 mm	Not used	N/A	
	Basic or supplementary insulation shall consist of at least two layers of material, which will meet the requirements of 4.4.7.8.1 and 4.4.7.10.1.		N/A	
	Double insulation shall consist of at least three lay- ers of material. Each layer shall meet the require- ments of 4.4.7.8.1 and 4.4.7.10.1, and any two lay- ers together shall meet the requirements of 4.4.7.10.2.		N/A	
	Reinforced insulation consisting of a single layer of material is not permitted.		N/A	
4.4.7.8.3.4	Compliance		Р	
	Compliance shall be checked by the tests de- scribed in 5.2.3.1 to 5.2.3.5.		Р	
	When a component or sub-assembly makes use of thin sheet insulating materials, it is permitted to per- form the tests on the component rather than on the material.			
4.4.7.8.4	Printed wiring boards (PWBs)		Р	
4.4.7.8.4.1	General		Р	
	Insulation between conductor layers in double- sided single-layer PWBs, multi-layer PWBs and		Р	

metal core PWBs, shall meet the requirements of 4.4.7.8.1. Basic, supplementary, double and reinforced insulation shall meet the appropriate requirements of 4.4.7.10.1 or 4.4.7.10.2. Functional insulation in PWBs shall meet the requirements of

For the inner layers of multi-layer PWBs, the insulation between adjacent tracks on the same layer

4.4.7.7.

IEC 62477-

·1	
	Result – Remark

Clause	Requirement – Test	Result – Remark	Verdict
	 shall be treated as either: a creepage distance for pollution degree 1 and a clearance as in air (see Example D.14); or solid insulation, in which case it shall meet the requirements of 4.4.7.8.1 and 4.4.7.10. 		
4.4.7.8.4.2	Use of coating materials	No such part	N/A
	A coating material used to provide functional, basic, supplementary and reinforced insulation shall meet the requirement as specified below.		N/A
	Type 1 protection (as defined in IEC 60664-3) im- proves the microenvironment of the parts under protection. The clearance and creepage distance of Table 10 and Table 11 for pollution degree 1 apply under the protection. Between two conductive parts, it is a requirement that one or both conduc- tive parts, together with all the spacing between them, are covered by the protection.		N/A
	Type 2 protection is considered to be similar to sol- id insulation. Under the protection, the require- ments for solid insulation specified in 4.4.7.8 are applicable, including the coating material itself, and spacings shall not be less than those specified in Table 1 of IEC 60664-3:2003. The requirements for clearance and creepage in Table 10 and Table 11 do not apply. Between two conductive parts, it is a requirement that both conductive parts, together with the spacing between them, are covered by the protection so that no air gap exists between the protective material, the conductive parts and the printed boards.		N/A
	The coating material used to provide Type 1 and Type 2 protection shall be designed to withstand the stresses anticipated to occur during the ex- pected lifetime of the PECS. A type test on repre- sentative PWBs shall be conducted according to Clause 5 of IEC 60664-3:2003. For the cold test (5.7.1 of IEC 60664-3:2003), a temperature of - 25 °C shall be used, and for the rapid change of temperature test (5.7.3 of IEC 60664-3:2003): - 25 °C to +125 °C. No routine test is required.		N/A
4.4.7.8.5	Wound components		N/A
	Varnish or enamel insulation of wires shall not be used for basic, supplementary, double or reinforced insulation. Wound components shall meet the requirements of		N/A
	4.4.7.8.1 and 4.4.7.10. The component itself shall pass the requirements given in 4.4.7.8.1 and 4.4.7.10.2. If the component has reinforced or double insulation, the a.c. or d.c. voltage test of 5.2.3.4 shall be performed as a rou- tine test.		

IEC 62477-1

Page 36 of 85

2	IEC 62477-1		
Clause	Requirement – Test	Result – Remark	Verdict
4.4.7.8.6	Potting materials		N/A
	A potting material may be used to provide solid in- sulation or to act as a coating to protect against pol- lution.		N/A
	If used as solid insulation, it shall comply with the requirements of 4.4.7.8.1 and 4.4.7.10.		N/A
	If used to protect against pollution, the require- ments for Type 1 protection in 4.4.7.8.4.2 apply.		N/A
4.4.7.9	Connection of parts of solid insulation (Cemented joints)		N/A
	The creepage and clearance path in the presence of a cemented joint between two insulating parts, are determined as follows.		N/A
	• Type 1 or type 2 protection as described in 4.4.7.8.4.2 apply.		
	• A cemented joint that is not evaluated as provid- ing protection of type 1 or type 2, is neither consid- ered solid insulation nor to reduce pollution degree. The clearance and creepage distances of Table 10 and Table 11 apply for the pollution degree of the environment around the joint. See 5.2.5.7 for test.		
4.4.7.10	Requirements for electrical withstand capability		Р
4.4.7.10.1	Basic or supplementary insulation	See Table 4.4.7.10	Р
	Test with impulse withstand voltage according to 5.2.3.1		Р
	Test with a.c. or d.c. voltage according to 5.2.3.4		Р
4.4.7.10.2	Double and reinforced insulation	See Table 4.4.7.10	Р
	 Double or reinforced insulation shall be tested as follows: Test with impulse withstand voltage according to 5.2.3.2; and Test with a.c. or d.c. voltage according to 5.2.3.4. 		P
	For solid insulation, the partial discharge test ac- cording to 5.2.3.5 shall be performed in addition to the above tests, if the recurring peak working volt- age across the insulation is greater than 750 V and the voltage stress on the insulation is greater than 1 kV/mm. The partial discharge test shall be performed as a type test on all components, sub-assemblies and PWB. In addition, a sample test shall be performed if the insulation consists of a single layer of materi- al.		P
	Double insulation shall be designed so that failure of the basic insulation or of the supplementary insu- lation will not result in reduction of the insulation capability of the remaining part of the insulation.		Р

IEC 62477-1

Page 37 of 85

	IEC 02477-1		
Clause	Requirement – Test	Result – Remark	Verdict
4.4.7.11	Insulation requirements above 30 kHz		N/A
4.4.8	Compatibility with residual current-operated protec- tive devices	No such devices	N/A
	 To ensure the intended work of an RCD provided by the installation PECS shall satisfy one of the fol- lowing conditions. a) A Pluggable Type A single-phase PECS, shall be designed so that, under normal and fault condi- tions any resulting d.c. component of the current in the PE conductor does not exceed the d.c. current withstand requirements in IEC 60755 for RCD of type A. b) For PECS that are Pluggable Type B or intended for permanent connection, d.c. current in the PE conductor is not limited if the information and mark- ing requirements of 6.3.7.4 are complied with. 		N/A
	Compliance with RCD provided by the installation shall be checked by simulation or calculation of cur- rent in the PE conductor under normal and single fault conditions according to the guideline provided in Annex H.		N/A
4.4.9	Capacitor discharge		Р
	 For protection against shock hazard, capacitors within a PECS shall be discharged to a voltage less than DVC As, or to a residual charge less than 50 μC, after the removal of power from the PECS: For pluggable PECS type A and B the discharge time shall not exceed 1 s or the hazardous live parts shall be protected against direct contact by at 		P
	 least IPXXB (see 4.4.3.3). For permanently connected PECS the discharge time shall not even a feet and feet and		
	time shall not exceed 5 s. For pluggable PECS type A and B and permanently connected PECS, which do not meet the above re- quirements, access shall only be possible by means of a tool or key and the information and marking requirements of 6.5.2 apply. Compliance is checked by test of 5.2.3.8.		
4.5	Protection against electrical energy hazards		Р
4.5.1	Operator Access Areas		Р
4.5.1.1	General		Р
	Equipment shall be so designed that there is no risk of electrical energy hazard in operator access are- as from accessible circuits by fulfilling requirement of 4.2.		P
	A risk of injury due to an electrical energy hazard exists if it is likely that two or more bare parts (one of which may be earthed) between which a hazard- ous energy level exists, will be bridged by a metallic		

IEC 62477-1

 Requirement – Test
 Result – Remark
 Verdict

 object.
 The likelihood of bridging the parts under consideration is determined by means of the test finger of Figure 1 of IEC 60529:1989, in a straight position. If it is possible to bridge the parts with this test finger.

	The likelihood of bridging the parts under consider- ation is determined by means of the test finger of Figure 1 of IEC 60529:1989, in a straight position. If it is possible to bridge the parts with this test finger, a hazardous energy level shall not exist.	
	Barriers, guards, and similar means preventing un- intentional contact may be provided as an alterna- tive to limiting the energy.	
	Compliance is checked by inspection or test of 5.2.2.2.	Р
4.5.1.2	Determination of hazardous energy level	Р
	 A hazardous electrical energy level is considered to exist if: the voltage is 2 V or more; and power available exceeds 240 VA after 60 s; or the energy exceeds 20 J. Compliance shall be checked with the test in 5.2.3.9 or by calculation. 	Ρ
4.5.2	Service Access Areas	Р
	Capacitors within a PECS shall be discharged to an energy level less than 20 J, as in 4.5.1.2, within 5 s after the removal of power from the PECS. If this requirement is not achievable for functional or other reasons, the information and marking requirements of 6.5.2 apply.	Ρ
	If the capacitor discharge time cannot be accurately calculated, the discharge time shall be measured.	Р
4.6	Protection against fire and thermal hazards	Р
4.6.1	Circuits representing a fire hazard	Р
	 The following types of circuits are considered a fire hazard: - circuits directly connected to the mains - circuits that are not directly connected to the mains but exceed the limits for limited power sources in 4.6.5 - components having unenclosed arcing parts 	Ρ
4.6.2	Components representing a fire hazard	Р
4.6.2.1	General	Р
	Compliance with 4.6.2 and 4.6.3 shall be confirmed by inspection of component and material data sheets and, where necessary, by test.	Р
4.6.2.2	Components within a circuit representing a fire hazard	Р
	Inside fire enclosures, materials for components and other parts and all materials in contact with	Р

Claubo	· · · · · · · · · · · · · · · · · · ·				
	such parts shall comply with flammability class V-2 as classified in IEC 60695-11-10 or flammability class HF-2 as classified in ISO 9772 or better.				
	The above requirement does not apply to any of the following:		Р		
	• electrical components which do not present a fire hazard under abnormal operating conditions when tested according to 5.2.4.6;				
	• materials and components within an enclosure of 0,06 m ³ or less, consisting totally of metal and having no ventilation openings, or within a sealed unit containing an inert gas;				
	• electronic components, such as integrated circuit packages, opto-coupler packages, capacitors and other small parts that are mounted on material of flammability class V-1 or better;				
	• wiring, cables and connectors insulated with PVC, TFE, PTFE, FEP, neoprene or polyimide;				
	• the following parts, provided that they are sepa- rated from electrical parts (other than insulated wires and cables) which under fault conditions are likely to produce a temperature that could cause ig- nition, by at least 13 mm of air or by a solid barrier of material of flammability class V-1 or better:				
	 other small parts which would contribute negligible fuel to a fire, including, labels, mounting feet, key caps, knobs and the like; 				
	 tubing for air or any fluid systems, containers for powders or liquids and foamed plastic parts, provided that they are of flammability class HB. 				
4.6.2.3	Components within a circuit not representing a fire hazard		Р		
	For components within a circuit not representing a fire hazard 4.6.2 does not apply.		Р		
4.6.3	Fire enclosures		Р		
4.6.3.1	General		Р		
	Fire enclosures are used to reduce the risk of fire to the environment, independent of the location where they are installed.	Metal enclosure	Р		
	A fire enclosure shall be provided for all PECS unless:				
	 the product committee specifies that a fire enclo- sure is not required; or 				
	 there is an agreement between the user and the manufacturer; or 				
	• the PECS is intended to be used only in areas without combustible materials and is marked according to 6.3.5.				
4.6.3.2	Flammability of enclosure materials		Р

	mounting surfaces, exceed the limit of Table 15, a warning according to 6.3.5 shall be provided.		
4.6.5	Limited power sources		N/A
	Where a limited power source is required, the source shall comply with Table 16 or Table 17 as applicable.		N/A
	 A limited power source shall comply with one of the following requirements: a) the output is inherently limited in compliance with Table 16; or b) a linear or non-linear impedance limits the output in compliance with Table 16. If a positive temperature coefficient device (e.g. PTC) is used, it shall pass the applicable tests specified in IEC 60730-1; or c) a regulating network limits the output in compliance with Table 16, both with and without a single fault in the regulating network; or d) an overcurrent protective device is used and the output is limited in compliance with Table 17. 		N/A
	power is checked by test of 5.2.3.9.		
4.7	Protection against mechanical hazards	Γ	Р
4.7.1	General		Р
	Failure of any component within the PECS shall not release sufficient energy to lead to a hazard, for example, expulsion of material into an area occu- pied by personnel.		Р
4.7.2	Specific requirements for liquid cooled PSCS		Р
4.7.2.1	General	A mixture of water and glycol	Р
4.7.2.2	Coolant		Р
	Coolant temperature in operation shall not exceed the limit specified in Table 14.		Р
	Compliance is checked by inspection and test of 5.2.3.10.		Р
4.7.2.3	Design requirements		Р
4.7.2.3.1	General		Р
	The liquid containment system components shall be compatible with the liquid to be used. Equipment using liquids shall be so constructed that it is unlikely that either a dangerous concentra- tion of these materials or a hazard in the meaning of this standard will be created by condensation, vaporization, leakage, spillage or corrosion during normal operation, storage, filling or emptying. Compliance is checked by inspection.		Ρ

IEC 62477-1

Page 43 of 85

	IEC 62477-1	I	
Clause	Requirement – Test	Result – Remark	Verdict
	The flexible hoses should be made of material free of conductive contaminants such as carbon.		
4.7.2.3.2	Corrosion requirements		Р
	All cooling system components shall be suitable for use with the specified coolant. They shall be corro- sion resistant and shall not corrode as a result of prolonged exposure to the coolant and/or air. Compliance is checked by inspection.		P
4.7.2.3.3	Tubing, joints and seals		Р
	Cooling <i>system</i> tubing, joints and seals shall be de- signed to prevent leakage during excursions of pressure over the life of the equipment. The entire cooling <i>system</i> including tubing shall satisfy the re- quirements of the hydrostatic pressure test of 5.2.7.		Р
4.7.2.3.4	Provision for condensation		Р
	 Where internal condensation occurs during normal operation or maintenance, measures shall be taken to prevent degradation of insulation. In those areas where such condensation is expected, clearance and creepage distances of Table 10 and Table 11 shall be evaluated at least for a pollution degree 3 environment (see Table 8), and provision shall be made to prevent accumulation of water (for example by providing a drain). Compliance is checked by inspection. 		Ρ
4.7.2.3.5	Leakage of coolant		Р
	During a leakage measures has to ensure that coolant will not result in wetting of live parts or electrical insulation.		Р
4.7.2.3.6	Loss of coolant		Р
	Loss of coolant form the cooling system shall not result in thermal hazards, explosion, or shock haz- ard. The requirements of the Loss of coolant test of 5.4.3.9.4 shall be satisfied.		P
4.7.2.3.7	Conductivity of coolant		N/A
	When the coolant is intentionally in contact with live parts (for example non-earthed heatsinks), the conductivity of the coolant shall be continuously monitored and controlled, in order to avoid hazard- ous current flow through the coolant.		N/A
4.7.2.3.8	Insulation requirements for coolant hoses		Р
	When the coolant is intentionally in contact with live parts (for example non-earthed heatsinks), the coolant hoses form a part of the insulation system. Depending on the location of the hoses, the re- quirements of 4.4.7 for functional or simple or pro- tective separation shall be applied where relevant.		P
4.8	Equipment with multiple sources of supply		Р

	 separate means of connection are provided for different circuits; and 			
	 supply plug connections, if any, are not in- terchangeable if a hazard could be created by incorrect plugging; and 			
	 hazards, within the meaning of this stand- ard, shall not be present under normal or single fault conditions due to the presence of multiple sources of supply. Actions such as disconnection or de-energizing of a supply are considered a normal condition. 			
	Compliance is checked by the evaluation of 4.2			
	Examples of the types of hazards that should be considered are:		Р	
	 a) Backfeed prevention – preventing voltage or energy available within the PECS or one of its sources from being fed back to any of the input terminals for another source, ei- ther directly or by a leakage path. 			
	b) Protection against unintentional islanding.c) Touch current levels may be higher with multiple sources connected simultaneously.			
	 d) Hazard resulting from damage to one or more connected sources due to energy from another source, for example the mains. 			
	 e) Damage to wiring due to currents higher than the wiring is designed for flowing from another source. 			
4.9	Protection against environmental stresses		Р	
	The manufacturer has to specify the following con- ditions for operation, storage and transportation ac- cording to IEC 60721:		Р	
	- Coolant temperature (min/max);			
	 Ambient temperature (min/max); 			
	- Humidity (min/max)			
	- Pollution degree;			
	- Vibration;			
	- U.V. resistance;			

- Over voltage category (OVC);

operation above 1000 m;

The manufacturer shall state the environmental

service condition for the PECS according to Table

- Altitude for thermal consideration, if rated for

- Altitude for insulation coordination considerations, if rated for operation above 2000 m.

	Page 45 of 85 IEC 62477-1		CN24PD8A 0
Clause	Requirement – Test	Result – Remark	Verdic
	18.		
4.10	Protection against Sonic Pressure Hazards		P
4.10.1	General		P
4.10.2	Sonic pressure and sound level		Р
	If the measured sound pressure exceeds 70 dBA (except that sounds from alarms are not included) the documentation shall provide information regard- ing the sound level of the equipment.	Less than 70 dBA	N/A
4.11	Wiring and connections		Р
4.11.1	General	Considered	Р
	The wiring and connections between parts of the equipment and within each part shall be protected from mechanical damage during installation. The insulation, conductors and routing of all wires of the equipment shall be suitable for the electrical, me- chanical, thermal and environmental conditions of use. Conductors which are able to contact each other shall be provided with insulation rated for the DVC requirements of the relevant circuits. The compliance with 4.11.2 to 4.11.8 shall be checked by inspection (see 5.2.1) of the overall construction and datasheets if applicable.		Ρ
4.11.2	Routing		Р
	A hole through which insulated wires pass in a sheet metal wall within the enclosure of the equip- ment shall be provided with a smooth, well-rounded bushing or grommet or shall have smooth, well- rounded surfaces upon which the wires bear to re- duce the risk of abrasion of the insulation.		Р
	Wires shall be routed away from sharp edges, screw threads, burrs, fins, moving parts, drawers, and similar parts, which abrade the wire insulation. The minimum bend radius specified by the wire manufacturer shall not be violated.		Р
	Clamps and guides, either metallic or non-metallic, used for routing stationary internal wiring shall be provided with smooth, well-rounded edges. The camping action and bearing surface shall be such that abrasion or deformation of the insulation does not occur. If a metal clamp is used for conductors having thermoplastic insulation less than 0,8 mm thick, non-conduction mechanical protection shall be provided.		Ρ
4.11.3	Colour coding		Р
	Insulated conductors, other than those which are integral of ribbon cable or multi-cord signal cable, identified by the colour green with or without one or more yellow stripes shall only be used for protective bonding.		Р

IEC 62477-1

<u></u>	IEC 62477-1				
Clause	Requirement – Test	Result – Remark	Verdict		
4.11.4	Splices and connections		Р		
	All splices and connections shall be mechanically secured and shall provide electrical continuity. Electrical connections shall be soldered, welded, crimped, or otherwise securely connected. A sol- dered joint, other than a component on a PWB, shall additionally be mechanically secured.		Р		
	NOTE Stranded wire should not be consolidated with solder where secured in a terminal that relies on pressure for contact or equivalent				
	When stranded internal wiring is connected to a wire-binding screw, the construction shall be such that loose strands of wire do not contact:				
	 other uninsulated live parts not always of the same potential as the wire; 				
	de-energized metal parts.				
	When screw terminal connections are used, the re- sulting connections may require routine mainte- nance (tightening). Appropriate reference shall be made in the maintenance manual (see 6.5.1).				
4.11.5	Accessible connections		N/A		
	In addition to measures given in 4.4.6.4 it shall be ensured that neither insertion error nor polarity re- versal of connectors can lead to a voltage on an accessible connection higher than the maximum of DVC As. This applies for example to plug-in sub- assemblies or other plug-in devices which can be plugged in without the use of a tool or key or which are accessible without the use of a tool or key. This does not apply to equipment intended to be in- stalled in restricted access areas. If relevant, non-interchangeability and protection		N/A		
	against polarity reversal of connectors, plugs and socket outlets shall be confirmed by inspection and trial insertion.				
4.11.6	Interconnections between parts of the PSCS		Р		
	In addition to complying with the requirements giv- en in 4.11.1 to 4.11.5, the means provided for the interconnection between parts of the PECS shall comply with the following requirements or those of 4.11.7.		Р		
	Cable assemblies and flexible cords provided for in- terconnection between sections of equipment or between units of a system shall be suitable for the service or use involved. Cables shall be protected from physical damage as they leave the enclosure and shall be provided with mechanical strain relief.				
	Misalignment of male and female connectors, inser- tion of a multipin male connector in a female con- nector other than the one intended to receive it, and other manipulations of parts which are accessible				

IEC 62477-1

Page 47 of 85

D

Clause	Requirement – Test	Result – Remark	Verdict
	to the operator shall not result in mechanical dam- age or a risk of thermal hazards, electric shock, or injury to persons. When external interconnecting cables terminate in a plug which mates with a receptacle on the exter- nal surface of an enclosure, no risk of electric shock shall exist at accessible contacts of either the plug or receptacle when disconnected. <i>NOTE An interlock circuit in the cable to de-</i> <i>energize the accessible contacts whenever an end</i> <i>of the cable is disconnected meets the intent of</i> <i>these requirements.</i>		
4.11.7	Supply connections		Р
	The connection points provided shall be of appro- priate construction to preclude the possibility of loose strands reducing the spacing between con- ductors when careful attention is paid to installation.		Р
4.11.8	Terminals		Р
4.11.8.1	Construction requirements		Р
	All parts of terminals which maintain contact and carry current shall be of metal having adequate mechanical strength. Terminal connections shall be such that the con- ductors can be connected by means of screws, springs or other equivalent means so as to ensure that the necessary contact pressure is maintained. Terminals shall be so constructed that the conduc- tors can be clamped between suitable surfaces without any significant damage either to conductors or terminals. Terminals shall not allow the conductors to be dis- placed or be displaced themselves in a manner det- rimental to the operation of equipment and the insu- lation shall not be reduced below the rated values. The requirements of this subclause are met by us- ing terminals complying with IEC 60947-7-1 or IEC 60947-7-2, as appropriate.		Ρ
4.11.8.2	Connecting capacity		Р
	Terminals shall be provided which accommodate the conductors specified in the installation and maintenance manuals (see 6.3.6.4) and cables in accordance with the wiring rules applicable at the installation. The terminals shall meet the tempera- ture rise test of 5.2.3.10.		Ρ
	Information regarding the permitted wire sizes shall be given in the installation manual.		Р
4.11.8.3	Connection		Р
	Terminals for connection to external conductors shall be readily accessible during installation.		Р

Requirement – Test

Clause

Clause	Requirement – rest	Result – Remark	Veruici
	Sets of terminals for connection to the same input or output shall be grouped together and shall be lo- cated in proximity to each other and to the main protective earthing terminal, if any. If the installation instructions provide detail on the proper earthing of the system, the protective earthing terminal need not be placed in proximity to the terminals. Clamping screws and nuts shall not serve to fix any other component although they may hold the termi- nals in place or prevent them from turning.		
4.11.8.4	Wire bending space for wires 10 mm ² and greater		Р
	The distance between a terminal for connection to the main supply, or between major parts of the PECS (for example a transformer), and an obstruc- tion toward which the wire is directed upon leaving the terminal shall be at least that specified in Table 19.		Ρ
4.12	Enclosures		Р
4.12.1	General		Р
4.12.2	Handles and manual controls		Р
	Handles, knobs, grips, levers and the like shall be reliably fixed so that they will not work loose in normal use, if this could result in a hazard. Sealing compounds and the like, other than self-hardening resins, shall not be used to prevent loosening. If handles, knobs and the like are used to indicate the position of switches or similar components, it shall not be possible to fix them in a wrong position if this could result in a hazard.		Р
4.12.3	Cast metal	Sheet metal	N/A
	 Die-cast metal, except at threaded holes for conduit, where a minimum of 6,4 mm thickness is required, shall be: not less than 2,0 mm thick for an area larger than 155 cm2 or having any dimension larger than 150 mm; not less than 1,2 mm thick for an area of 155 cm2 or less and having no dimension larger than 150 mm. The area under evaluation may be bounded by reinforcing ribs subdividing a larger area. Malleable iron or permanent-mould cast aluminium, brass, bronze, or zinc, except at threaded holes for conduit, where a minimum of 6,4 mm thickness is required, shall be: at least 2,4 mm thick for an area greater than 155 cm2 or less having no dimension more than 150 mm; at least 1,5 mm thick for an area of 155 cm2 or less having no dimension more than 150 mm. Clause	Requirement – Test	Result – Remark	Verdict
	PECS delivered for the test is as expected with re- spect to supply voltage, input and output ranges, etc.		
5.2.2	Mechanical tests		Р
5.2.2.1	Clearances and creepage distance (type test)	See table 5.2.2.1 for details	Р
	It shall be verified by measurement or visual in- spection that the clearance and creepage distances comply with 4.4.7.4 and 4.4.7.5.		Р
	Where this verification is impossible to perform, an impulse voltage test (see 5.2.3.2) shall be performed between the considered circuits.		Р
5.2.2.2	Non-accessibility test (type test)		Р
	This test is intended to show that live parts, pro- tected by means of enclosures and barriers in compliance with 4.4.3.3, are not accessible.	IP54	Р
	This test shall be performed as a type test of the enclosure of a PSCS as specified in IEC 60529 for the enclosure classification for protection against access to hazardous parts.		Р
	 Except as noted below: The test probe for IP3X shall not penetrate the top surface of the enclosure when probed from the vertical direction ± 5° only. 		N/A
5.2.2.3	Ingress protection test (IP rating) (type test)		Р
	The claimed IP rating of the enclosure shall be veri- fied. This test shall be performed as a type test of the enclosure of a PSCS as specified in IEC 60529 for the enclosure classification.	IP rating of the enclosure: IP54	Р
5.2.2.4	Enclosure integrity test (type test)		Р
5.2.2.4.1	General		Р
	The integrity tests apply to PSCS, and also where PSCS are intended for operation without a further enclosure in restricted access areas. After comple- tion of the integrity test, the PSCS shall pass the tests of 5.2.3.2 and 5.2.3.4 and shall be inspected to confirm that:		P
	- no degradation of any safety-relevant component of the PSCS has occurred.		Р
	- live parts have not become accessible (see 4.4.3.3).		Р
	- enclosures show no cracks or openings which could cause a hazard.		Р
	- clearances are not less than their minimum per- mitted values and other insulation is undamaged.		Р
	- barriers have not been damaged or loosened.		Р

Clause	Requirement – Test	Result – Remark	Verdict
	An a.c. or d.c. voltage test according to 5.2.3.4 may be used as an alternative method to the impulse voltage test of 5.2.3.2.		N/A
	For an a.c. voltage test the peak value of the a.c. test voltage shall be equal to the impulse test of Table 25 and applied for three cycles of the a.c. test voltage.		N/A
	For a d.c. voltage test the average value of the d.c. test voltage shall be equal to the impulse test voltage of Table 25 and applied three times for 10 ms in each polarity.		N/A
	See IEC60664-1 clause 6.1.2.2.2 for further information.		N/A
5.2.3.4	A.C. or d.c. voltage test (type test and routine test)		Р
5.2.3.4.1	Purpose of test		Р
	The test is used to verify that the clearances and solid insulation of components and of assembled PSCS has adequate dielectric strength to resist temporary overvoltage conditions.		Ρ
5.2.3.4.2	Value and type of test voltage		Р
	The values of the test voltage for circuits connected to mains supply are determined from column 2 or 3 of Table 26. The voltage test shall be performed with a sinusoi- dal voltage at 50 Hz or 60 Hz. If the circuit contains capacitors the test may be performed with a d.c. voltage of a value equal to the peak value of the specified a.c. voltage.		Ρ
5.2.3.4.3	Performing the voltage test	See table 4.4.7.10	Р
	 a) Test (1) between accessible conductive part 8connected to earth) and each circuit se- quentially (except DVC As circuits). Test voltage according to Table 26, or Table 27, column 2, corresponding to voltage of con- sidered circuit under test. Test (2) between accessible surface (non- conductive or conductive but not connected to earth9 and each circuit sequentially (ex- cept DVC As circuits). Test voltage accord- ing to Table 26 or Table 27, column 3 (for type test) or column 2 (for routine test), cor- responding to voltage of considered circuit under test. 		Ρ
	 b) Test between each considered circuit se- quentially and the other adjacent circuits connected together. Test voltage according to Table 26 or Table 27, column 2, corre- sponding to voltage of considered circuit under test. 		Ρ

TÜVRheinland[®]

Report No.: CN24PD8A 001

Page 53 of 85

IEC 62477-1	
-------------	--

Clause	Requirement – Test	Result – Remark	Verdict
	c) Test between DVC As circuit and each ad- jacent circuit sequentially. Test voltage ac- cording to Table 26 or Table 27, column 3 (for type test) or column 2 (for routine test), corresponding to the circuit with the higher voltage. Either the adjacent circuit or the DVC As circuit may be earthed for this test. It is necessary to test functional insulation between PELV and SELV circuits, but it is not necessary to test functional insulation between adjacent PELV or adjacent SELV circuits.		P
5.2.3.4.4	Duration of the a.c. or d.c. voltage test		Р
	The duration of the test shall be at least 60 s for the type test and 1 s for the routine test. The test voltage may be applied with increasing and/or decreasing ramp voltage but the full voltage shall be maintained for 60 s and 1 s respectively for type and routine tests.		Ρ
5.2.3.4.5	Verification of the a.c. or d.c. voltage test		Р
	The test is successfully passed if no electrical breakdown occurs during the test.		Р
5.2.3.5	Partial discharge test (type test, sample test)		N/A
	The partial discharge test shall confirm that the sol- id insulation (see 4.4.7.8) used in components and subassemblies for protective separation of electri- cal circuits remains partial-discharge-free within the specified voltage range (see Table 28).		N/A
	This test shall be performed as a type test and a sample test. It may be omitted for insulating materials which are not degraded by partial discharge, for example ceramics. The partial discharge inception and extinction voltage are influenced by climatic factors (e.g. temperature and moisture), equipment self-heating, and manufacturing tolerance. These influencing variables can be significant under certain conditions and shall therefore be taken into account during type testing.		N/A
5.2.3.6	Protective impedance (type test and routine test)		N/A
	A type test shall be performed to verify that the cur- rent through a protective impedance under normal operating or single-fault conditions does not exceed the values given in 4.4.3.4. The test shall be per- formed using the circuit of IEC 60990:1999, Figure 4. NOTE IEC 60990 states that the use of a single network for the measurement of a.c. combined with d.c. has not been investigated, but no suggestion is made for measurement in such cases. The value of the protective impedance shall be veri-		N/A

Result – Remark Verdict

	fied as a routine test.	
5.2.3.7	Touch current measurement (type test)	Р
	The touch current shall be measured to determine if the measures of protection need not be taken (see 4.4.4.3.3). The PECS shall be set up in an insulat- ed state without any connection to the earth and shall be operated at rated voltage. Under these conditions, the touch current shall be measured be- tween the means of connection for the PE conduc- tor and the PE conductor itself with the test circuit of Figure 4 of IEC 60990:1999.	P
	• For a PSCS to be connected to an earthed neutral system, the neutral of the mains of the test site shall be directly connected to the protective earthing conductor.	Р
	• For a PSCS to be connected to an earthed neutral system, the neutral shall be connected through a resistance of 1 k Ω to the protective earthing conductor which shall be connected to each input phase in turn. The highest value will be taken as the definitive result.	N/A
	• For a PSCS to be connected to a corner earthed system, the protective earthing conductor shall be connected to each input phase in turn. The highest value will be taken as the definitive result.	N/A
	• For a PSCS with a particular earthing system, this system shall operate as intended during the test.	N/A
	• If a PSCS is intended to be connected to more than one system network, each of these different system networks (or the worst-case, if that can be determined) shall be used to make the touch cur- rent measurement.	N/A
5.2.3.8	Capacitor discharge (type test)	Р
	The capacitor discharge time as required by 4.4.3.4 may be verified by a type test and/or by calculation taking into account the relevant tolerances.	Р
5.2.3.9	Limited power source test (type test)	N/A
	When required by 4.6.5 a limited power circuit shall be tested as below, with the equipment operating under normal operating conditions. In case the limited power source requirement de- pends on overcurrent protective device(s), the de- vice(s) shall be short-circuited.	N/A
	With the equipment operating under normal operat- ing conditions, a variable resistive load is connect- ed to the parts under consideration and adjusted to obtain a level required limited VA power. Further adjustment is made, if necessary, to maintain the limited VA power for a period specified by 4.6.5. A variable resistive load is connected to the circuit

	 under consideration and adjusted to obtain the limit of apparent power as indicated in Table 16 or Table 17, as applicable. Further adjustment is made, if necessary, to maintain the limit of apparent power for the time period indicated in Table 16 or Table 17, as applicable. The test is passed, if after the test period the avail- able apparent power does not exceed the limits in- dicated in Table 16 or Table 17, as applicable. In case the limited power source requirement de- 		
	pends on overcurrent protective device(s), the cur- rent rating of at least one of the protective device(s) in the current path shall not exceed the limit in Ta- ble 17.		
5.2.3.10	Temperature rise test (type test)		Р
	If possible the PECS must operate in the worst conditions of the rated power and the output current.		Р
	Equipment, in which the heating or cooling quantity depends on the temperature, the temperature measurement must be carried out under the most unfavourable conditions of ambient temperature within the range specified by the manufacturer.		Р
	The PECS shall be tested with at least 1,2 m of wire attached to each field wiring terminal. The wire shall be of the smallest size intended to be con- nected to the PECS as specified by the manufac- turer for installation. When there is only provision for the connection of bus-bars to the PECS, they shall be of the minimum size intended to be con- nected to the PECS as specified by the manufac- turer, and they shall be at least 1,2 m in length.		P
	The test shall be maintained until thermal stabiliza- tion has been reached. That is, when three succes- sive readings, taken at intervals of 10 % of the pre- viously elapsed duration of the test and not less than 10 min. intervals, indicate no change in tem- perature, defined as \pm 1 °C between any of the three successive readings, with respect to the am- bient temperature.		P
	The temperature of an electrical insulation (other than that of windings) is measured on the surface of the insulation at a point close to the heat source, if a failure of this insulation could cause a hazard. If temperatures of windings are measured by the thermocouple method, the thermocouple shall be located on the surface of the winding assuming the hottest part due to surrounding heat emitting com- ponents. See also notes in Table 14.		P
	The maximum temperature attained shall be cor- rected to the rated ambient temperature of the PSCS by adding the difference between the ambi-		Р

Clause	Requirement – Test	Result – Remark	Verdict
	tection for the equipment or part of the equipment under consideration, as follows:		
	• for pluggable equipment type A, the overcurrent protective device is that provided external to the equipment (for example, in the building wiring, in the mains plug or in an equipment rack);		
	• for pluggable equipment type B and permanently connected equipment, the maximum rating of the overcurrent protective device specified in the equipment installation instructions to be provided external to the equipment;		
	• the rating of the provided overcurrent device for a circuit or part of the equipment for which an over- current protective device is provided as part of the equipment.		
5.2.3.11.2. 2	Test current, duration, and acceptance criteria:		Р
	a) For PECS with an overcurrent protective device rating of 16 A or less, this test may be omitted, if an impedance not exceeding 0,1 Ω can be demonstrated.		N/A
	b) As an alternative to Table 29, where the time- current characteristic of the overcurrent protective device that limits the fault current in the protective equipotential bonding means is known because the device is either provided in the equipment or fully specified in the installation instructions, the test du- ration may be based on that specific device's time- current characteristic. The tests are conducted for a duration corresponding to the 200 % current value on the time-current characteristic.	0.011 Ω	P
	c) For PECS with an overcurrent protective device rating of more than 460 A, calculations or simula- tions according to IEC 60949 shall be used to show the ability of the prospective short circuit current to fulfil the requirements. The protective equipotential bonding continuity routine test of 5.2.3.11.4 shall be performed to show that the impedance of the pro- tective equipotential bonding means during and at the end of the test shall not exceed the expected value.		N/A
	Acceptance criteria: The test current is 200 % of the overcurrent protective device rating and the du- ration of the test is as shown in Table 29. The volt- age drop in the protective equipotential bonding means, during and at the end of the test, shall not exceed DVC As, as determined from Table 2 and Table 5 with respect to the accessible surface of the enclosure.		Р
	After the tests, visual inspection shall show no damage to the <i>protective equipotential bonding</i> means.		Ρ

	Requirement – Test	Result – Remark	Verdict
	Protective bonding short circuit withstand test (type test)		N/A
-		-	

5.2.3.11.3	Protective bonding short circuit withstand test (type test)		N/A
	As required by 5.2.3.11.2.1, the short circuit test in 5.2.4.3 shall be performed to ensure that protective bonding has the ability to withstand the prospective short circuit current that it may be subjected to under fault conditions.		N/A
	The testing shall include an individual test of the protective bonding path for each conductive acces- sible part unless analysis shows that the short cir- cuit withstand capability of the path is adequate, or that the results of one combination are representa- tive of the anticipated results of another combina- tion.		N/A
5.2.3.11.4	Protective bonding continuity test (routine test)		N/A
5.2.4	Abnormal operation and simulated faults tests		Р
5.2.4.1	General	See table 4.2 and 4.3	Р
5.2.4.2	Pass criteria		Р
	 As a result of the abnormal operation tests, the PSCS shall comply with the following: there shall be no emission of flame, burning particles or molten metal; the surgical cotton indicator shall not have ignited; the earth connection and protective bonding of the PSCS shall not have opened; doors and cover shall remain in place; during and after the test, accessible DVC As, SELV and PELV circuits and accessible conductive parts shall not exhibit voltages greater than the time dependent voltages of Figure 1, Figure 2 or Figure 3, as appropriate and shall be separated from live parts at voltages greater than DVC As with at least basic insulation. Compliance shall be checked by the a.c./d.c. insulation 		P
	 test of 5.2.3.4 for basic insulation; during and after the test, live parts at voltages greater than DVC As shall not become accessible. components, e.g. busbar supports, used for the mounting of live parts not break away from their initial position, (IEC 62477-1:2012/AMD1:2016) no conductor shall get pulled out of its terminal connector. (IEC 62477-1:2012/AMD1:2016) 		
	The PSCS is not required to be operational after testing and it is possible that the enclosure can be-		Р

	come deformed. Overcurrent protection integral to the PECS, or required to be used with the PECS, is allowed to open.		
5.2.4.3	Protective bonding short circuit withstand test (type t	est)	N/A
5.2.4.3.1	General		N/A
	When required by 5.2.3.11.2.1, a protective bond- ing path shall be subjected to the following short- circuit withstand test.		N/A
5.2.4.3.2	Test conditions		N/A
	The equipment under test shall be supplied with power and the output port shall be operating as in- tended in 5.2.4.1 prior to closing the switching means that applied will be more severe.		N/A
	The protective bonding short circuit test shall be performed with the PSCS working with light load, unless analysis shows that higher short circuit cur- rents are available under higher loading conditions.		N/A
	A new sample may be used for each short-circuit test.		N/A
5.2.4.3.3	Protective equipotential bonding short-circuit test method		N/A
5.2.4.3.4	Pass criteria		N/A
5.2.4.4	Output Short-circuit test (type test)		Р
5.2.4.4.1	Load conditions		Р
	The short circuit test shall be performed with the PSCS at full load or light load whichever creates the more severe condition.		Р
5.2.4.4.2	Short-circuit test method		Р
	In addition to determining compliance with the crite- ria of 5.2.4.2, this test is used to determine the out- put short circuit current rating of the port under consideration, in accordance with 4.3.2.3. An oscil- loscope or other suitable instrument shall be used to measure the peak current during the test, and to measure or calculate the r.m.s. value of the current.		Ρ
	The value(s) to be recorded and to be provided with the PECS instructions, in accordance with 6.2, are the peak current, and the highest of the r.m.s. cur- rent values measured or calculated over a time pe- riod as follows:	15.3kA/1.15ms	Р
	a) for a.c. signals, three cycles of the nominal a.c. frequency for the port under consideration, in which case the value is to be stated as the 3-cycle r.m.s. value;		
	b) for all signals, the duration of the short circuit from the time the short circuit is applied, until the time the short circuit current is interrupted by a pro- tective device or other mechanism, in which case		

IEC 62477-1

Page 60 of 85

	Result – Remark	

	120 02477-1		
Clause	Requirement – Test	Result – Remark	Verdict
	 the value stated is to include the r.m.s. value and the time period in seconds; c) for short circuit tests that result in a continuous non-zero value, the steady-state r.m.s. value, in which case the value is to be stated as a continuous r.m.s value. For PECS with internal short circuit protection according to 4.3.2.3, which protects the output port within some few µs, the requirements in a), b) and c) are not applicable. 		
5.2.4.5	Output Overload test (type test)	No overload capability	N/A
5.2.4.6	Breakdown of components test (type test)		Р
5.2.4.6.1	Load conditions	See table 4.2 and 4.3	Р
	The breakdown of a component, identified as a re- sult of the circuit analysis of 4.2, shall be tested with the PSCS at full load or light load whichever creates the more severe condition.		Р
5.2.4.6.2	Application of short-circuit or open-circuit		Р
	The short circuit shall be applied with cable of a cross-section appropriate for the current that nor- mally flows through the component, but no less than 2.5 mm ² . The length of the loop shall be as short as practical to perform the test. Short circuits and open circuits are applied using an appropriate switching device.		P
	Each identified component shall be subjected to on- ly one breakdown of components test unless both open- and short-circuit failure modes are likely in that component.		Р
5.2.4.6.3	Test sequence		Р
	For the Breakdown of components test, identified components shall be short-circuited or open-circuited, whichever creates the worst hazard, one at a time.		Р
5.2.4.7	PWB short-circuit test (type test)		N/A
	On PWBs, functional insulation provided by spac- ings which are less than those specified in Table 10 and Table 11 (see 4.4.7.7) shall be type tested as described below.		N/A
	The decreased spacings shall be short-circuited one at a time, on representative samples, and the short-circuit shall be maintained until no further damage occurs.		N/A
5.2.4.8	Loss of phase (type test)		Р
	A multi-phase PSCS shall be operated with each line (including neutral, if used) disconnected in turn at the input. The test shall be performed by discon- necting one line with the power conversion equip-		Р

IEC 62477-1

	IEC 62477-1		
Clause	Requirement – Test	Result – Remark	Verdict
	ment operating at its maximum normal load and shall be repeated by initially energizing the device with on lead disconnected.		
	The test shall continue until terminated by a protec- tive mechanism, a component failure occurs, or the temperature stabilizes.		Р
	This particular requirement may be simulated for PSCS with rated input current greater than 500 A.		Р
5.2.4.9	Cooling failure tests (type test)		Р
5.2.4.9.1	General and pass criteria		Р
	For PSCS having a combination of cooling mecha- nisms, all relevant tests shall be performed. It is not necessary to perform the tests simultaneously. The test shall continue, - until the temperature stabilizes, in which case the temperature limits of 4.6.4.2 apply;		Р
	or - until terminated by a protective mechanism or a component failure occurs, in which case the tem- perature limits of 4.6.4.2 may be exceeded by not more than 5°C. If this is not possible a warning statement shall be provided in the user documenta- tion.		
	NOTE The temperature increase of 5 °C with re- gard to the steady state limits reflect the spread of the burn threshold given in IEC Guide 117.		P
5.2.4.9.2	Inoperative blower motor		N/A
	A PSCS having forced ventilation shall be operated at rated load with fan or blower motor or motors made inoperative, singly or in combination from a single fault, by physically preventing their rotation.		N/A
5.2.4.9.3	Clogged filter		N/A
	Enclosed PSCS having filtered ventilation openings shall be operated with the openings blocked to rep- resent clogged filters. The test shall be performed initially with the ventilation openings blocked 50 %. The test shall be repeated under full blocked condi- tion.		N/A
5.2.4.9.4	Loss of coolant		Р
	A liquid cooled PSCS shall be operated at rated load. Loss of coolant shall be simulated by draining the coolant, blocking the flow or disabling the sys- tem coolant pump.		Р
	If the PSCS is shut down due to the operation of a thermal device located inside the coolant, then the test shall be repeated with the coolant drained out of the system.		P
	NOTE: It is presumed that the thermal device will		Р

	Page 62 of 85	Report No.	: CN24PD8A 00
	IEC 62477-1	T	
Clause	Requirement – Test	Result – Remark	Verdict
	be inoperative if not surrounded by coolant liquid.		
5.2.5	Material tests		Р
5.2.5.1	General		Р
	 When requested by 4.4.7.8.2, the manufacturer shall test the flammability properties of the materials used for insulating purposes, as defined in 5.2.5.2, 5.2.5.3 and 5.2.5.4. When requested by 4.6.3.2 the manufacturer shall test the flammability properties of the materials used for fire enclosure, as defined in 5.2.5.5. 		P
5.2.5.2	High current arcing ignition test (type test)		N/A
5.2.5.3	Glow-wire test (type test)		Р
	The glow-wire test shall be made under the condi- tions specified in 4.4.7.8.2 according to IEC 60695- 2-10 and IEC 60695-2-13.		Р
5.2.5.4	Hot wire ignition test (type test – alternative to Glow-wire test)		N/A
5.2.5.5	Flammability test (type test)		N/A
5.2.5.6	Flaming oil test (type test)		N/A
5.2.5.7	Test of cemented joints (type test)		N/A
	When required by 4.4.7.9 representative samples of cemented joints providing protection of type 1 or type 2 as defined in IEC 60664-3:2003 shall be tested as a type test as follows.		N/A
	The samples shall be subjected to the conditioning procedure specified in 5.7 of IEC 60664-3:2003, using the following parameters: for the cold test (5.7.1), a temperature of -25 °C shall be used, and for the rapid change of temperature test (5.7.3): -25 °C to +125 °C.		
	After the conditioning the samples shall pass the		

	following tests in the prescribed order:	
	 a) The mechanical strength of the joint shall be evaluated by loading the joint using the forces anticipated to be present under normal conditions. There shall be no sepa- ration of the parts. 	
	 b) The insulation resistance between the con- ductive parts separated by the joint shall be measured according to 5.8.3 of IEC 60664- 3:2003. 	
	 c) Cemented joints shall be treated as to be thin sheet material and shall be tested ac- cording 4.4.7.8.3. 	
	 d) The sectioning of the joint shall not show any cracks, voids or separation. 	
5.2.6	Environmental tests (type test)	

IEC 62477-1

Page 63 of 85

	ILC 02477-1		
Clause	Requirement – Test	Result – Remark	Verdict
5.2.6.1	General		Р
	Compliance is shown by conducting test of 5.2.6.3, 5.2.6.4, 5.2.6.5 and 5.2.6.6 according to Table 30 as applicable for the environmental conditions specified by the manufacture.		Р
5.2.6.2	Acceptance criteria		Р
	 The following acceptance criteria shall be satisfied: no degradation of any safety-relevant component of the PSCS; no potentially hazardous behaviour of the PSCS during the test; no sign of component overheating; no live part shall become accessible; no cracks in the enclosure and no damaged or loose insulators; pass routine a.c. or d.c. voltage test 5.2.3.4; pass protective bonding test 5.2.3.11.2; 		Ρ
	 no potentially hazardous behaviour when the PSCS is operated following the test. 		
5.2.6.3	Climatic tests	1	Р
5.2.6.3.1	Dry heat test (steady state)		Р
	To prove the ability of components and equipment to be operated, transported or stored at high tem- peratures the dry heat (steady state) test shall be performed according to the conditions specified in Table 31.		Р
5.2.6.3.2	Damp heat test (steady state)		Р
	To prove the resistance to humidity, the PSCS shall be subjected to a Damp heat test (steady state) ac- cording to Table 32.		Р
5.2.6.4	Vibration test (type test)		Р
	 To verify the mechanical vibration strength the PECS in combination with its installation shall be evaluated by: a) tests defined in this section according to the conditions specified in Table 33; or b) calculation or simulation based on tests, as defined in this section, on a representative model of PECS. For PSCS with a mass more than 100 kg, this test may be performed on sub-assemblies. NOTE For large equipment, the possibility of using a shock test as an alternative to a vibration test is under consideration. 		Ρ
5.2.6.5	Salt mist (type test)		Р
	1	1	1

Р

Р

Ρ

Page 64 of 85

IEC	62477-1	

Clause	Requirement – Test	Result – Remark	Verdict
	To verify the resistance against salt mist, the PECS in combination with its installation shall be evaluat- ed by tests defined in this section according to the conditions specified in Table 34. For PSCS with a mass more than 100 kg, this test may be performed on sub-assemblies.	Severity level 2	Р
5.2.6.6	Dust and sand (type test)		N/A
	To verify the mechanical strength against dust and sand the PECS in combination with its installation shall be evaluated by tests defined in this section under the conditions specified in Table 35. For PSCS with a mass more than 100 kg, this test may be performed on sub-assemblies.	PECS is not intended to be used in the environmental condition of dust and sand, which specified by the manu- facturer.	N/A
5.2.7	Hydrostatic pressure (type test and routine test)		Р
	 For type tests, the pressure inside the cooling system of a liquid cooled PSCS (see 4.7.2.3.3) shall be increased at a gradual rate until a pressure relief mechanism (if provided) operates, or until a pressure of twice the operating value or 1,5 times the maximum pressure rating of the system is achieved, whichever is the greater. <i>NOTE: for the purpose of this test the coolant pump may be disabled.</i> For routine tests, the pressure shall be increased to the maximum pressure rating of the system. The pressure shall be maintained for at least one minute. There shall be no thermal, shock, or other hazard resulting from the test. There shall be no significant leakage of coolant or loss of pressure during the test, other than from a pressure relief mechanism during a type test. After the hydrostatic pressure type test the PSCS shall pass the a.c. or d.c. voltage test 5.2.3.4. 		Ρ

 Result – Remark
 Verdict

 In order to prevent injury or damage, the installation
 P

	In order to prevent injury or damage, the installation documents shall include warnings of any hazards which can be experienced during installation. Where necessary, instructions shall be provided for:	Ρ
	 packing and unpacking; moving; lifting; strength and rigidity of mounting surface; fastening; provision of adequate access for operation, adjustment and maintenance. 	
6.3.5	Enclosure temperature	Р
	When surface temperatures of the PECS, close to mounting surfaces, exceed the limit of 4.6.4.2, the installation manual shall contain a warning to consider the combustibility of the mounting surface.	Р
	Where required by 4.6.3.1, the following marking shall appear on the PECS and in the installation instructions: "suitable for mounting on concrete or other non-combustible surfaces only".	Ρ
6.3.6	Connections	Р
6.3.6.1	General	Р
	Information shall be provided to enable the installer to make safe electrical connection to the PSCS. This shall include information for protection against hazards (for example, electric shock or availability of energy) that may be encountered during installa- tion, operation or maintenance.	Ρ
6.3.6.2	Interconnection and wiring diagrams	Р
	The installation and maintenance manuals shall in- clude details of all necessary connections, together with a suggested interconnection diagram.	Р
6.3.6.3	Conductor (cable) selection	Р
	The Installation manual shall define the voltage and current levels for all connections to the PSCS, together with cable insulation requirements. These shall be worst-case values, taking into account overcurrent and overload conditions and the possible effects of non-sinusoidal currents.	Ρ
6.3.6.4	Terminal capacity and identification	Р
	The installation and maintenance manuals shall indi- cate the range of acceptable conductor sizes and types (solid or stranded) for all terminals, and also the maximum number of conductors which can sim- ultaneously be connected.	Ρ
	For field wiring terminals, the manuals shall specify	Р

Clause

	the requirements for tightening torque values and al- so the insulation temperature rating requirements for the conductor or cable.		
	The identification of all field wiring terminals shall be marked on the PSCS, either directly or by label at- tached close to the terminals.		Р
	The installation and maintenance manuals identify all external terminals relating to circuits protected by one of the methods of 4.4.6.4.		Р
6.3.7	Protection requirements		Р
6.3.7.1	Accessible parts circuits		Р
	The installation, users and maintenance manuals shall identify any accessible parts at voltages greater than DVC As, and shall describe the insulation and separation provisions required for protection.		Ρ
	The manuals shall also indicate the precautions to be taken to ensure that the safety of DVC As con- nections maintained during installation.		Р
	Where a hazard is present after the removal of a cover, a warning label shall be placed on the equipment. The label shall be visible before the cover is removed.		Ρ
	The manual of a PSCS state the maximum voltage allowed to be connected to each port.		Р
	The manuals provide instructions for the use of PELF circuits within a zone of equipotential bonding.		Р
6.3.7.2	Type of electrical supply system		Р
	The installation manual or the PECS specify re- quirements for safe earthing including the permitted earthing system of the installation (see 4.4.7.1.4)		Р
	The unacceptable earthing systems shall be indicated as:		Р
	 not permitted; or with modification of values and/or safety levels which shall be quantified through type test. 		
6.3.7.3	Protective class		Р
6.3.7.3.1	General		Р
	The installation manual of the PECS shall declare the protective class specified for the PECS and the product shall be marked according to the require- ment of 6.3.7.3.2, 6.3.7.3.3, and 6.3.7.3.4.		Р
6.3.7.3.2	Protective class I equipment		Р
	Terminals for connection of the PE conductor shall be clearly and indelibly marked with one or more of the following:		Р
	The symbol IEC 60417-5019 (2011-01)		Р

	With the letters PE		P
	The colour coding green or green-yellow		Р
6.3.7.3.3	Protective class II equipment	Class I equipment	N/A
	Equipment of protective class II shall be marked with symbol IEC 60417-5172 (2011-01) (see Annex C). Where such equipment has provision for the connec- tion of an earthing conductor for functional reasons (see 4.4.6.3) it shall be marked with symbol IEC 60417-5018 (2011-01) (see Annex C).		N/A
6.3.7.3.4	Protective class III equipment		N/A
	No marking is required on the product.		N/A
6.3.7.4	Touch current marking		N/A
	Where the touch current in the PE conductor exceeds the limits given in 4.4.4.3.3., this shall be stated in the installation and maintenance manuals. In addition, a warning symbol ISO 7010- W001 (2011-06) (see Annex C) shall be placed on the product, and a notice shall be provided in the installation manual to instruct the user that the minimum size of the PE conductor shall comply with the local safety regulations for high PE conductor current equipment.		N/A
6.3.7.5	Compatibility with RCD marking		N/A
	The installation and maintenance manuals shall indi- cate compatibility with RCDs (see 4.4.8). When 4.4.8 b) applies, a caution notice and the symbol ISO 7010-W001 (2011-06) (see Annex C) shall be pro- vided in the user manual, and the symbol shall be placed on the product. The caution notice shall be the following or equivalent: "This product can cause a d.c. current in the PE conductor. Where a residual current-operated protective device (RCD) is used for protection against electrical shock, only an RCD of Type B is allowed on the supply side of this product." (See 6.4.3 for general requirements for labels, signs and signals.)		N/A
6.3.7.6	Cable and connection		Р
	Any particular cable and connection requirements shall be identified in the installation and maintenance manuals.		Р
6.3.7.7	External protection devices		N/A
	Where external devices are necessary to protect against hazards, the installation manual shall specify the required characteristics (see also 5.2.4 and 4.3.2.1)		N/A
6.3.8	Commissioning		Р
	If commissioning tests are necessary to ensure the electrical and thermal safety of a PSCS, information to support these tests shall be provided for each part		Р

	of the PSCS. This information can depend on the specific installation, and close cooperation between manufacturer, installer, and user can be required. Commissioning information shall include references to hazards that might be encountered during com- missioning, for example those mentioned in 6.4. and 6.5.		
6.4	Information for use		Р
6.4.1	General		Р
	The user's manual shall include all information re- garding the safe operation of the PSCS. In particular, it shall identify any hazardous materials and risks of electrical shock, overheating, misuse of the PSCS.		Р
	The manual should also indicate any hazards which can result from reasonably foreseeable misuse of the PSCS.		Р
6.4.2	Adjustment		Р
	The user's manual shall give details of all safety- relevant adjustments intended for the user. The identification or function of each control or indicating device and fuse shall be marked adjacent to the item. Where it is not possible to do this on the prod- uct, the information shall be provided pictorially in the manual.		Р
	Maintenance adjustments may also be described in this manual, but shall be made clear that they should only be made by qualified personnel.		Р
	Clear warnings shall be provided where excessive adjustment could lead to a hazardous state of the PSCS.		Р
	Any special equipment necessary for making ad- justments shall be specified and described.		Р
6.4.3	Labels, signs and signals		Р
6.4.3.1	General		Р
	Labelling shall be in accordance with good ergonom- ic principles so that notices, controls, indications, test facilities, fuses, etc., are sensibly placed and logical- ly grouped to facilitate correct and unambiguous identification.		P
	All safety related equipment labels shall be located so as to be visible after installation or readily visible by opening a door or removing a cover. Where a symbol is used, the information provided with the PSCS shall contain an explanation of the symbol and its magning		
	symbol and its meaning.		P
	 wherever possible, use international symbols as given by ISO 3864-1, ISO 7000 or IEC 60417;

 Verdict

 • if no international symbol is available, be worded in encountered and the second state of the second state of

r		1	
	• if no international symbol is available, be worded in an appropriate language or in a language associated with a particular technical field;		
	 be concise and unambiguous; 		
	 be conspicuous, legible and durable; 		
	• state the hazards involved and give ways in which risks can be reduced.		
	When instructing the person(s) concerned as to		Р
	 what to avoid: the wording should include "no", "do not", or "prohibited"; 		
	 what to do: the wording should include "shall", or "must"; 		
	• the nature of the hazard: the wording should in- clude "caution", "warning", or "danger", as appropri- ate;		
	• the nature of safe conditions: the wording should include the noun appropriate to the safety device.		
	Safety signs shall comply with ISO 3864-1.		Р
	The signal words indicated hereinafter shall be used and the following hierarchy respected:		Р
	• DANGER to call attention to a high risk, for example: "High voltage".		
	• WARNING to call attention to a medium risk, for example: "This surface can be hot."		
	• CAUTION to call attention to a low risk, for example: "Some of the tests specified in this standard involve the use of processes imposing risks on persons concerned."		
	Danger, warning and caution markings on the PECS shall be prefixed with the word "DANGER", "WARNING", or "CAUTION" as appropriate in let- ters not less than 3,2 mm high. The remaining let- ters of such markings shall be not less than 1,6 mm high.		
6.4.3.2	Isolators		Р
	Where an isolating device is not intended to interrupt load current, a warning shall state: DO NOT OPEN UNDER LOAD.		Р
	The following requirements apply to any supply iso- lating device which does not disconnect all sources of power to the PSCS.		Р
	If the isolating device is mounted in an equipment enclosure with the operating handle externally oper- able, a warning label shall be provided adjacent to the operating handle starting that it does not discon- nect all power to the PSCS.		Ρ
	Where a control circuit disconnector can be con- fused with power circuit disconnectors due to size or location, a warning label shall be provided adjacent		Р

Clause

IEC 62477-1

Page 71 of 85

Clause	Requirement – Test	Result – Remark	Verdic
	to the operating handle of the control disconnector stating that it does not disconnect all power to the PSCS.		
6.4.3.3	Visual and audible signals		Р
	Visual signals such as flashing lights, and addible signals such as sirens, may be used to warn of an impending hazardous event such as the driven equipment start-up and shall be identified. It is essential that these signals:		P
	- are unambiguous;		
	- can be clearly perceived and differentiated from all other signals used;		
	- can be clearly recognized by the user;		
	 are emitted before the occurrence of the hazardous event. 		
	It is recommended that higher frequency flashing lights be used for information.		
	Note: IEC 60073 provides guidance on recommend- ed flashing rates and on/off ratios.		
6.4.3.4	Hot surfaces	No need	N/A
	Where required by 4.6.4.2 the warning symbol W017 of ISO 7010 shall be marked on or adjacent to parts exceeding the touch temperature limits of Table 15.		N/A
6.4.3.5	Equipment marking		Р
	The Identification of each control or indicating device and fuse shall be marked adjacent to the item. Re- placeable fuses shall be marked with their rating and time characteristics. Where it is not possible to do this on the product, the information shall be provided pictorially in the manual.		P
	Appropriate identification shall be marked on or ad- jacent to each movable connector.		
	Test points shall be individually marked with the cir- cuit diagram reference.		
	The polarity of any polarized devices shall be marked adjacent to the device.		
	The diagram reference and if possible the function shall be marked adjacent to each pre-set control in a position where it is clearly visible while the adjust- ment is being made.		
6.5	Information for maintenance		Р
6.5.1	General		Р
	The PECS shall be marked with the date code, or serial number from which the date of manufacture can be determined.		Р
	Safety information shall be provided in the installa- tion and maintenance manuals including appropri- ate, the following:		Р

IEC 62477-1

Page 72 of 85

IEC 62477-1			
Clause	Requirement – Test	Result – Remark	Verdict
	Preventive maintenance procedures and schedules		Р
	Safety precautions during maintenance		Р
	• Location of live parts that can be accessible during maintenance (for example, when covers are re-moved9		Р
	Adjustment procedures		Р
	Subassembly and component repair and replace- ment procedures		Р
	Any other relevant information		Р
6.5.2	Capacitor discharge		Р
	When the requirements 4.4.9 are not met, the warn- ing symbol W012 of ISO 7010 and an indication of the discharge time (for example, 45 s, 5 min) shall be placed in a clearly visible position on the enclo- sure, the capacitor protective barrier, or at a point close to the capacitor(s) concerned (depending on the construction). The symbol shall be explained and the time required for the capacitors to discharge after the removal or the power from the PSCS shall be stated in the installation and maintenance manuals.		Ρ
6.5.3	Auto restart/bypass connection		N/A
	If a PSCS can be configured to provide automatic restart or bypass connection, the installation, user and maintenance manuals shall contain appropriate warning statements.		N/A
	A PSCS which is set to provide automatic restart or bypass connection, after the removal of power, shall be clearly identified at the installation.		N/A
6.5.4	Other hazards		N/A
	The manufacturer shall identify any components and materials of a PSCS which require special proce- dures to prevent hazards.		N/A
6.5.5	Equipment with multiple sources of supply		N/A
	In accordance with 4.8, where there is more than one source of supply energizing the PSCS, infor- mation shall be provided to indicate which discon- nect device or devices are required to be operated in order to completely isolate the equipment.		N/A

Clause	Requirement – Test	Result – Remark	Verdict

FOREWORD	Р
This document (EN 62477-1:2012/A11:2014) has been prepared by CLC/TC 22X "Power electron- ics".	Р
The aim behind this Amendment is to link EN 62477-1:2012 to the Low Voltage Directive 2006/95/EC, further to a CLC/TC 22X request, approved by the Technical Board by the decision D146/C017.	
In addition, a recent Technical Board decision (D147/C061), confirmed that EN 62477-1:2012 par- tially supersedes EN 50178:1997.	
This standard covers the Principle Elements of the Safety Objectives for Electrical Equipment Designed for Use within Certain Voltage Limits (LVD - 2006/95/EC).

Clause	Requirement – Test	Result – Remark	Verdict		
ZZ	ANNEX ZZ (INFORMATIVE) RELATIONSHIP BETWEEN THIS EUROPEAN STANDARD AND THE SAFETY OBJECTIVES OF DIRECTIVE 2014/35/EU [2014 OJ L96] AIMED TO BE COVERED		Р		
	This European standard has been prepared under a Commission's standardisation request relating to harmonised standards in the field of the Low Volt- age Directive, M/511, to provide one voluntary means of conforming to safety objectives of Di- rective 2014/35/EU of the European Parliament and of the Council of 26 February 2014 on the harmoni- sation of the laws of the Member States relating to the making available on the market of electrical equipment designed for use within certain voltage limits [2014 OJ L96].		P		
	Once this standard is cited in the Official Journal of the European Union under that Directive, compli- ance with the normative clauses of this standard given in Table ZZ.1 confers, within the limits of the scope of this standard, a presumption of conformity with the corresponding safety objectives of that Di- rective, and associated EFTA regulations.
